377. APRS Cave Radio

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 19 Aug 1996 00:44:09 -0400 (EDT)
To: aprssig@tapr.org
Cc: bedfordMD@aol.com
Message-ID: <Pine.GSO.3.95.960818234852.8094A-100000@arctic>
Rendered body type: text/plain

Went home to alabama for 30th H.S. reunion and scheduled a crawl in the old favorite cave to test VHF APRS comms underground. Governemnt has barred up all N.Alabama caves (hundreds) so got Pres of Ala Spelogical Society to get keys and permsision. Date and time arrived but Pres was found in hospital with bad back. He told us where the backdoor was and how to get around the baracade...

But of course, it was a mottley crew. My 80 year old dad, brother with braces on both legs, and two kids (8 and 6)... My brother and I toe crawled through the tiny "back door" which included slithering over about 30 feet of sloping rock at 30 degrees down in to a "bottomless pit" Once we got in, then we could walk over to the main entrance (about 2 feet by 4 feet and totally blocked by steel plate and bars). ALthough the kids could fit between the bars, it was a tripple 90 degree process with one leg and elbow at a time to negotiate the narrow space between rock and bars. Also, since the kids had never seen a cave in their life, it took some coaxing from us on the inside to suck them in. ALl they could see of us were our hands and lights...

My dad, an ex-FBI agent of 35 years, who in my youth would not tollerate even the slightest dissrespect for laws whether logical or not, has mellowed over the years and looked the other way.
He decided he has seen it all before and would volunteer
to take up radio position number one at the entrance...(and not get muddy)

Once inside,
My Brother, my kids and I walked only 100 yards further and discovered the real baracade which was 4 inch angle iron weleded in bat-safe fashion from floor to ceiling and wall to wall about 10 feet high by 30 feet wide. But of course, there was the usual wiggle hole that has evolved around the right edge which of course was easy for the kids but hard for my brother and me. Once on the other side, about 100 feet I decided to make my first radio check and got no response from my dad at the mouth. Realizing he was deaf in one ear and had only 50% hearing in the other, I muttered at my stupidity for not having made radio checks from the beginnning...

Then I went back to the baracade and again tried in vain to raise my dad only 100 yards back and blocked by no more than probably 30 feet of rock from line of sight.. Grumbling I crawled back around the baracade went back to the very mouth and still couldnt raise him. WIth enough yelling, I raised him accoustically (he was out looking for a walking stick to whittle on while he stood radio watch.. (with the radio in his back pocket). Even I cant hear these little ICOM's even with the volume all the way up!

This time, I more carefully assigned him a spot inside the mouth of the cave that was more line of sight to us but on the outside of the "bottomless pit". I made his orders more definitive this time: "to stay put and man the radio" All of this without being able to see him on the other side of the steel plate and bars at the entrance...

Again, I proceeded to the baracade (about 100 yards in) and though the copy was solid, was surprised to hear noisy spots as I moved. Crawled back around the baracade and lost him again! ARGH! But at least I proved that the 3 feet by 4 inch horizontal slots in the bat-safe angle iron baracade were an almost perfect 2 meter filter. BACK AOURND the baracade again, I went to retrieve the radio from my dad and relieve him of his post so that I could bring the radio in and perform remaining tests all on the interior side of the baracade, this time with my brother being the other end of the link...

Now I proceeded to get my brother and kids safely all the way to the end of the 600 foot main chamber so then I could return to the baracade and make a test. Again, I didnt bother to make a radio check until I was at leat out of flashlight range. Again no response and muttering words about radio incompetance went back to brother and kids and found out he was pushing the FUNCTION button instead of the PTT. Back again I went and finally got a good radio check over about 450 feet. THis is a straght long chamber. I went the next 150 feet and with only a 10 degree change in main chamber angle, began to hear null spots and can you belive it, poor comms! I could still see the (very dim) but reflected light from his light at theend of the chamber and when we could get the kids quiet enough, we could easily holler back and forth but had poor radio comms! THis main chamber is tyupically 50 feet wide and between a minimum of 10 feet to 30 feet tall.

The next test area was probably more typical of actual caving. It was a very curvy passage about 5 feet wide and 3 feet tall. A cake walk for the kids but a duck walk for us. Again, a few hundered feet in, no comms! Yeling at my brother (ive had 45 years of practice) did not improve radio comms until I duck walked back to within less than 100 feet! At that distance (if you could keep the kids quiet (an impossible task)) we could communicate by voice in almost normal tones. BUT NOT BY RADIO!

This was a very humbling experience. HAMS have talked to the space shuttle with 2 watt HTs over paths of over 1000 miles but I could just not believe that my radio was useless over a 100 foot path along an only slightly serpentine route through solid rock. and that I could communicate better by voice than by radio. All of my early caving buddies were also my HAM buddies, but back then there was no such thing as a 2 meter HT...

The next night I shared this experience with the Pres of the N.Ala Spelogical society (Who coincidentally was studying for his TECH!) and he brought over his complete data base of N.Ala caves. Hundreds.
Can you believe one of the caves in Huntsville has a 437 foot pit! That is a straight down freefall. It takes a team of 12 just to carry the single piece of rope the 4 hours into the cave where the pit is! In the 100% humidity, no light can penetrate the mist the full 437 feet. I am awed by the bravery of these guys who go down the rope anyway!

CONCLUSIONS:
1) VHF is "PURELY" line of sight. In my brief test, there appear to be no obvious waveguide or reflection effect of any significant value. I would love to do this more scientifically, with known antennas (not SHORT stubby rubber ducks)

2) What about UHF? Sure wish I had taken dual band HT's for the test...

3) Caves come in all shapes and sizes.. Most have easy parts and hard parts. The best caves usually have the HARD spots at the beginning which has kept out the distruction of man over millions of years. The cave we had intended to visit was "newely discovered". It was called elbow cave because the entrance was about the size of the opening in a dog house and required you to place your left elbow over your head, make two 90 degree bends wiggling on your side through about the first 15 feet. From then on, it was over 3 miles of heads-up walking through virgin beauty.. But it took 30 minutes to get in just the first 50 feet.

CONCLUSION: Using APRS hand held digipeaters to establish multiple VHF packet links into a cave has its greatest potential to establsih an in-cave communications "base camp". This comm link may not proceed to the furthreset point in a cave, but it can provide a link from deep within to the outside world (all the way back in town). This forward comm "base camp" may save 30 minutes to hours in communications, if the only other alternative is to send out a human through the "hard parts"...

The nearest cave rescue team in all of North ALabama is in Huntsville, over 70 miles from our caving area. From the mouth of the cave, we could hit Huntsville via 2 digis! In the case of elbow cave, just 50 feet of coax to the first of several in-cave digipeaters would save 30 minutes or more off of the communications path!

4) I was amazed at the distance of accoustic comms over serpentine paths that were useless for radio. In the pure silence of a cave, how far could packet tones be transmitted accoustically?? What is the best tone frequencies? Just replace the radios in that packet link with speakers, mics and audio amps! at the duty cycle of an APRS packet, I bet you could build a 10 watt accoustic digipeater in the same 1 liter package as

```
an HT digipeater...  Except for water drips, the silence in a cave should
give unbelievable signal to noise beyond our usual above ground accoustic
experience....

Anyway, LOTS of areas for experimentation!  We aren't talking kids stuff.
When these guys go in, they plan on spending MANY hours in the cave,
because usually they spend the first several hours just getting to the
area of today's exploration.  (Rules require each person to carry 3 days
water and rations.)  Providing an APRS comm link is an exciting
challenge that must be met link-by link using what ever is appropriate:
 * normal VHF/UHF for long straight shots
 * twisted pair for short serpentine, or major re-direction
 * Accoustic links as a replacement for twisted pair?
 * long wire coupling around tight areas?

If you are intersetd in further APRS-CAVE-RADIO discussion, send me
private reply and i will add you to a brief distro list...

Bill, Huntsville is the caving capitol of the whole south!  Might be an
interesting area to explore for Huntsville APRS folks.  Remember since GPS
will never go inside a cave, you can make an APRS CAVE map as fast as you
can move a mouse!

Is this any worse than some of the other advertising I see on the sig?
Either all advertising is allowed or no advertising is allowed. Heck,
I've even read postings on production runs of merchandise and
confirmation of orders.  The proliferation of this type of stuff
should come as no surprise to all, particularly in view of what has
been posted in the past.
```

73, George KD4FJ.

----------
George, you will get no argument from me in regards to stoping all
advertising in this sig.. However, I can stand the ads that are in someway
related to or associated with APRS operation.. Out and Out advertising for
a server isn't in any way related to APRS operations.

380. ATTENTION APRS PACNWEST (MT,ID,WA,OR)

From: DDOBBINS@aol.com
Date: Mon, 19 Aug 1996 09:12:32 -0400
To: aprssig@tapr.org
Message-ID: <960819091231_459894965@emout15.mail.aol.com>
Rendered body type: text/plain

Is it still OK to post APRS messages on the APRS SIG?? HA HA.

This is your APRS PACNWEST Coordinator, calling all those interested in MONTANA, IDAHO, WASHINGTON, and OREGON to drop me a message or contact me at the address following this posting, so I can get you on the e-mailing list for the APRS PACNWEST monthly bulletin. Include Name, c/s, address, phone, e-mail, pager, cell-phone, packet address, and name of your favorite pet.

As YOUR coordinator, I feel it my responsibility to lead the way in map development, and educating interested persons about APRS. I am busily making maps derived from the 1:2M CDROM, and have borrowed the 1:100K CDROM to start on some city maps. Perhaps you've already pulled the PNWMAP08.ZIP file from the TAPR/APRSSIG/UPLOAD area, and have seen the results of mine, and others, work so far. Well, this past weekend I've started on the following maps:

MT: Great Falls, Butte, Billings, Kalispell, and Helena. Going to remake the MTState.map.
ID: Couerd'alene
WA: Port Angeles Hydro area (all P-Sound), Olympia, Tacoma, Wenatchee, and Centralia
OR: (Waiting for someone to ask for an area)

I've heard a couple Seattle-locals talking about APRS on the 444.7 repeater. I couldn't get back to them in time to offer assistance. If you need help, email me, or call me at temp #206-631-3266, in Kent. I'm available for club meetings, etc., and really want to get a strong APRS network going here in the PACNWEST. In future would like to have our own local WEB site with FAQS, links and files for those interested, plus access to a BBS to store APRS files for those not on internet (Yes, there are still some holdouts left out there).

Give me a hollar. NOW. Aloha, Dave Dobbins/WH6YC, qth Seattle, WA

I have tried twice to unsuccessfully un-subscribe to your list server. Now I
think I have subscribed twice.

Would you please un-subscribe me twice...

Thanks in advance for your assistance.

Rendered body type: text/plain

Seeing the Java APRS servers, which is an excelent programming job,
I had some thoughts about the creation of "Virtual APRS Internet Network".

Imagine this scenario:

One way Gates form hf to vhf (Allready exist)
One way or (full) Gates form vhf to Internet.

These gates can excange APRS Packets at a selected reserved tcp port in a
way similar the "Ping Pong" Conference Servers do.

This way we can introduce data into this "virtual network" from "interfaces"
distributed all over the world, and constant update of the world map.
As the success of APRS depents of the number of users (especially mobiles)
It's obvious this way APRS can also be introduced to areas were there
in not APRS activity.

In order to achieve this APRS must become tcpip compatible, perhaps it is
easier to modify WINAPRS so it becomes an Winsock application.
Win APPRS has the additional advantage to allow many maps to be open
simultaneously on the screen.

the Java APRS servers may have a central role in this virtual network.
As curently they luck the ability to update each other.
Also the problem of each server offering a limited selection of maps
must be resolved.

Any comment please?

Tasos Zachariou

Please don't do this on 14.100 MHz.  That's the frequency
of the worldwide NCDXF beacon network (unless it's been
moved in the last year or so).

/////////////////////////////////////
Thanks Robert,

I am sorry about the confussion.
I am not Transmiting on 14.100.00, My vfo is tuned there.
My tx fre. is 2110 and 2310 down from there.

Could you please check if I am QRM ing that fre?
if NCDXF is CW at 800 to 1000 hz I don't see a problem?
my beacon is set at every 6 min. so u will have to wait a while
to hear me.
I don't belive that I will be heard in CW mode, naturaly I will
be heard on side band, but that will not effect CW copy because
osc above 1000 hz will be filter out.

73      Roger

Nah, I need to apologize.  As someone else pointed out to me
via email I did not read closely enough to see where the
signal actually was (not the freq readout).

> Could you please check if I am QRM ing that fre?

I read the latest QST, and they had a run down
on APRS using GPS... I have thought about
getting a GPS reciever and implementing it with
my APRS station, and other applications, such
as, the LAT/LON of my X1J node, mapping the
local area on a lap top, etc..

Since I am new to the SIG, and want to learn
more, can someone enlighten me with some
of the more cheaper GPS recievers, but with
some great features built in.

You can call it NON-APRS, yes, but I want to
set myself straight, by saying...

If you have an axe to grind on NON-APRS subjects,
send it to the person personally, and not to the
WHOLE NET!!! Some will say that I started the
whole advertising schpeel about JUNO, quite
frankly, it was not so...

My feeling is...

I wanted to get an E-Mail account,
since I have no ISP available here, yes, I am one
of the few in the world that has no "true" access
to the I-Net... I got the chance through JUNO,
since they had what I wanted for the time being,
E-Mail, whether free or not, but I was willing to risk
signing up. I recieved the TAPR SIG's via packet, but
most of the messages were weeks old by the time
I got them.

Leave the bashing, personal attacks, humor at one's
expense to the "Chicken Bander's"... Use good
judgment as Ham Radio Operators...

Lets get back to APRS... That's all I ask.

Thanks 4 checking Joel,

My beam is west now fer the rest of the day I think. I'll try agn
off and on this week. I am seeing a lot of activity around 14.100
so far have seen 3 aprs station but seemed to be running auto.
all in the 5 call area. I'll leave it on tonite, could there be
a VK or ZL out there? Who knows.

404. Questions...

From: tdrumm@sparc.isl.net (Tony Drumm)
Date: Mon, 19 Aug 1996 22:42:35 -0500
To: aprssig@tapr.org
Message-ID: <199608200352.WAA07339@sparc.isl.net>
Rendered body type: text/plain

```
I've been making progress with APRS but have some questions.

Apparently, there was a command to set the alias to WIDE, but it's been
removed.  True?   If so, what's the accepted way to set a WIDE alias such
that APRS knows you did it?  I can set it using O-C-T, of course.  I'm not
the best station for WIDE, but I seem to at least receive the closest WIDE
station better than others in my area so I've run with a WIDE alias on and
off to help those others get more posits on their screens.  We suddenly have
a number of new users playing with APRS in our area (Rochester, MN) so the
network here is not really established.  We need a good WIDE eventually...

I'm having a problem with APRS getting hung up after some period of time.  I
*think* this is happening when it is trying to send something to the TNC and
might be due to the TNC.  Does APRS use software handshaking?  Can it use
hardware handshaking?  XON/XOFF has been an occassional problem with my TNC
- it works better in hardware mode.  Has anyone else seen this sort of
problem?  The symptom is that APRS will not respond to keystrokes but the
computer is not entirely locked.  Ctrl-Alt-Del still works.  Today when it
happened, I noticed the "sending to TNC" message was on the screen.
(Running 7.6f)

Finally, I'm using a PK12 in the car as a tracker and have done a little
map-making using the posits.  I've noticed that sometimes the tracker sends
an extra line after the GPS info (GPS-20).  I don't know if it's a CR or LF
or both.  I noticed this mainly when it's transmitting data when the GPS
doesn't yet have a fix.  But, that seems to be when I'm looking at it most
carefully so I can't be sure it isn't doing this always.  Sound familiar to
anyone?  BTW, I just figured out the remote programming for the TNC and it's
a pretty cool feature.

Thanks for any and all help!
73,
Tony Drumm

Cc: APRSSIG@tapr.org, N2CZF@magg.net, WB4APR@amsat.org, DMOBLEY@encore.com
Message-ID: <960819234832_505368730@emout15.mail.aol.com>
Rendered body type: text/plain

```
Ok guys..the shirt design is AWSOME...IT really came out great.
Got the fax of it this afternoon...

Here is the deal...need input from you guys...

If we go with a collar shirt we use the APRS GLOBE with sats revolving around
it  (for a great example see the GPS article on PAGE 56  in SEPT QST)  The
logo and printing are the size of a large police badge and will be located on
Right upper breast area.

Above it    HAM RADIO  APRS

              LOGO

Below it  "We know where to find you"

If we do the collar shirt there would not be anything on the back of the
shirt cause it'll look dumb and not too professional.   The collar shirt will
cost a little more (based on response will dictate price)

If we do a  T_SHIRT   cheaper...

ON FRONT      LOGO with
on top of it   APRS
```

On bottom of it "we know where to find you"

On back of TSHIRT
Large logo
on TOP HAM RADIO APRS
Below AUTOMATED PACKET REPORTING SYSTEM

ANY SUGGESTIONS would be appreciated as Im not in this kinda buisness and lack creativity..

My personal choice is the collar shirt, nothing on back. Small badge logo on front Maybe change it to APRS USER GROUP or something...

#1 Interested ? (cost around $20.00)
#2 Changes ?
#3 Ideas ?

I want to get this done this week... Please take a sec and send me the info about what you would like to see...
The shirts will be available for the MELBOURNE HAMFEST and Im not making any profit here...It's just for fun and comraderie..
NOTE: APRS EVENT ORGANIZERS !! Get your group these cool shirts... Make a good impression on the organization you serve..(dont forget to shave !)

Mike

407. Hacked DGPS Beacon Rcvr

From: kc5ejk@onramp.net (Robert Winingham)
Date: Tue, 20 Aug 1996 06:33:36 -0600
To: aprssig@tapr.org
Message-ID: <v02140b01ae3f5f6b5174@[199.1.11.119]>
Rendered body type: text/plain

Here is some very interesting news about DGPS from the
Newsgroups: sci.geo.satellite-nav :

From: rcochran@netcom.com (Richard Cochran)
Newsgroups: sci.geo.satellite-nav
Subject: Hacked DGPS Beacon Rcvr Success!
Date: Mon, 19 Aug 1996 04:29:41 GMT

I got a DGPS fix with a homebrew DGPS beacon receiver!!!!

I've been working on this far longer than I'd like to mention, as some of you may remember from my earlier posts. Yesterday I finally got a chance to put all the pieces together. I can now use my homebrew DGPS beacon receiver to feed the Coast Guard corrections to my Garmin G45, and it all works! It's not yet portable, but that's a minor detail that can be taken care of.

Many thanks to lots of you for your suggestions and words of encouragement. I absolutely couldn't have done this without the help of the net.

My advice to those wanting to build your own DGPS receiver: don't bother, unless it's your idea of recreation. You'll have much less hassle by buying a $500.00 commercial receiver. The parts for my receiver would probably cost around $1000.00, but since I already had the shortwave and the computer laying around (the most expensive parts), I only shelled out about $100.00 extra, plus a few thousand dollars worth of my time figuring out how to make it work. My receiver is much more clumsy and physically awkward than any commercial design. I'm still considering buying a pager-sized commercial unit from DCI. Still, I'm pretty happy that my homebrew receiver works!

Outline of design:

I'm using a Sony ICF 2010 general purpose portable shortwave receiver to receive the Coast Guard beacon on Angel Island (San Francisco Bay, California). I'm feeding the audio output from the shortwave into a cheap MFJ-1225 RTTY computer interface (it uses an XR2211 chip to do the FSK demodulation). The MFJ produces raw digital logical level output at 200BPS, with no buffering or other intelligence to the signal. I'm sending the raw digital signal to the CTS handshake line (Pin 8 of a 9-pin RS-232 cable) on a serial port of my DOS computer. I've written some software to watch the CTS handshake line, and read the 200 BPS bitstream (I did this by modifying some public-domain software written for Ham RTTY). Then I'm sending the data out to my Garmin G45 GPS via a second serial port. The only processing my computer is doing is converting the 200 baud syncronous bitstream from the beacon receiver to 4800 baud RS-232 asyncronous.

> that APRS knows you did it?

*** Use O-C-T mode and set one of the other TNC calls to WIDE, such as the MYNode or MYHost calls. Dont try to use MYAlias since APRS will force that back to RELAY... Notice that APRS does *not* need to know that your attached TNC is a WIDE too. that is only a TNC function. But if you set one of your other aliases to WIDE, then you should put that in your POSIT COMMENT filed so that you will show as GREEN.

The Kantronics TNC's have these alternate calls, and the new PacComm Pico TNC has four separate aliases! I believe the AEA has a MYGate call that can be used (Not to be coufused with Kantornics GATES which we all use for our HF/VHF gateways)...

415. WinAPRS Version 1.1.3

From: sproul@ap.org (Mark Sproul)
Date: Tue, 20 Aug 1996 12:24:28 -0400
To: aprssig@tapr.org
Message-ID: <v02130500ae3f9091b899@[165.1.27.20]>
Rendered body type: text/plain

```
I have uploaded the latest version of WinAPRS to

        Rutgers ftp://aprs.rutgers.edu/aprs
        TAPR ftp://ftp.tapr.org/tapr/SIG/aprssig/files/winstuff/WinAPRS/

The changes for this version are

Version 1.1.3
        Added on-line Help (WINHELPP)
        Added installation diagnostics, on startup it checks for required
                and optional files and informs the user if it
                finds anything wrong.
        Civil Air Patrol Search And Rescue grids (grids work, labeling is
                not complete)
        Zip code display
        Zip code option for global labels
        Davis Instruments weather station support finished

Please not that the ON-LINE help included with this release is NOT as
uptodate as the documentation on the Web site

HSP support is still not complete and is STILL the number one item on my
list, it is just taking longer than I had hoped.

Special thanks to Warren Walker for his assistance with the Windows Help.

Mark

Hi all APRS users,

   Have seen NIL on the sig since mid June about MIC ENCODER/MIM use, hows
it working out for those using same. Any bugs, improvments, advancements,
no comments, or any general informative information on how the Mic Encoder
or Mim chip is being used/utilized etc..Any TELEMETERY activity with Mim.?

   How about some input on same, from the experimenters, users.
```

Gwyn/W1BEL your msg of 6/11 any progress or beta version from your establishment as yet. Anticipated availability, with the GPS-20.?????
Any good news, bad news, forget about it ?.I'll help test it when ready.

What are these STAMPS, I see mentioned here on the SIG, what are they ?, where available, am in a fog (as usual ere on coast) about STAMPS are they similar to the MIM chip and do similar things.

Anyone for some 15M HF testing of APRS next weekend. Any reports on 15M propgation etc.. No comments on CWID stations all 4 corners and KC area of US. on our aprs hf 30M freq..

While this may have come up at some point in the past, the archives of the SIG are much too daunting. I also don't know how to search them for this subject :-)

Can a PK232MBX function as a standalone tracker TNC; i.e., just the GPS, the TNC and a radio?

Thanks in advance.

>Can a PK232MBX function as a standalone tracker TNC; i.e., just the GPS,
>the TNC and a radio?

Yes, with the latest revision of the firmware. I believe it gives the same functionality as the PK12.
If your PK232MBX is a bit old (before they introduced pactor) like mine, the upgrade is quite expensive: >80$.

Well seems like the majority likes the collar shirt.

Also many did like the T shirt though and will investigate and get details
tomorrow and post tomorrow afternoon.

I'll talk to the guy and see if I can get the coffee cups done up too...

SO...probably a white polo shirt, APRS logo and maybe pocket on front
as well...Emblem would be a small silk screened aprs logo as mentioned
before. Nothing on back.  "we know wher to find you...blah blah)

Will find out about call letters for indiviudals that would mach font of
aprs.
ALL would be a single color I think..

I do know I guy at the mall who scans in pictures and then a super cool
machine stiches (embroiders..?) it...Looks neat..
Please no requests for golf balls...You guys are wierding out on me..
No pens either !!  Coffee cups ok...

Will remove HAM radio from it as well.. Will change to POSITION not packet.
 Anything else ?
Prices tomorrow with possible TAPR upload of scanned image..
ALL FINAL DETAILS TOMORROW..

Mike

Actually, your last line told me what I "really" wanted to know - how does
APRS decide that something is WIDE and show it as green.  So, sounds like
it's the word "WIDE" in the posit comment.  Other question, then, is: what
color do you get if you are both a WIDE and a WX station?  Cyan?

I'm hoping we can find a more suitable station/location to be the local WIDE
digi so these are mostly curiosity questions.

Bill, I have constructed a MIM back pack portable tracker with mine.
Have tested it and works well under certain conditions.  Use the MIM with
a GPS-20 and Maxon 5 watt transmitter.  All is packaged in a 4x5x7 box
including two 12 volt two amp hour batteries.  Having a small problem
with RFI between the maxon and the gps/mim but hope to have that worked
out so that I can walk around and beacon my location.  This is in
preparation for a walk america event i want to participate in.\

Will be trying the MIC sometime soon as well.  Telemetry will come later.
Sam K3BY in Delaware.

Message-ID: <199608210053.UAA29125@onramp.i95.net>
Rendered body type: text/plain

```
HELP!!!

Sorry to ask this again but I am going nuts!!

Working with a KPC-3 TNC and a Magellan NAV 1200 XL GPS.  This GPS is the
same as the Meridian XL.  It is a vehicle mount instead of a portable.  Has
a seperate weatherproof antenna that mounts outside.  There are 7 wires that
come out of the harness.  Red and Bare for Power.  Red and White for
External Alarm.  Yellow and Brown for DBR.  Orange and Bare for NMEA Device.
The NMEA selection from the unit is NMEA 0183A, 0183B and 0183C.   There are
4 buad rates that can be selected 1200, 4800, 9600, 19200.  How do I connect
this GPS to the KPC-3 TNC?

Thanks in advance!!

The South Florida WHEELER Bike club is having an annual

100 MILE (YUP NOT A TYPO)
BIKE EVENT..

We have everyone signed up for he event but could use a extra tracker thats
portable..If you got one and want to help, let me know.

Event is Sunday, Sept 8

Mike KD4EMI

I got the idea guys....everyone wants a shirt...

You dont have to email the sig with the request..

When I get 'em, you'll get 'em...

They will be white polo with blue or black or red letters...Will see..
Lets change the subject for now...
Any comments about shirt design, please send me direct..
KD4EMI@AOL.COM
BUT
Before you ask, here are the answers...

YES WILL GET THEM IN BOTH POLO and T SHIRTS...
YES I'll GET THEM TO EVERYONE NOT JUST AT THE HAMFEST
YES WILL TRY FOR COFFEE CUP...
YES WILL TRY FOR STITCHING...

YES I'll TRY TO GET THEM CHEAP...

Im going for mostly large and extra larges and XXX larges...
No one has asked for a small one yet..!!!!
Dont worry, you'll get one soon..(Less than 2 weeks)
Though everyone "wants" one, I'll probably one run 30 the first time..
Mike

>Actually, your last line told me what I "really" wanted to know - how does
>APRS decide that something is WIDE and show it as green. So, sounds like
>it's the word "WIDE" in the posit comment. Other question, then, is: what
>color do you get if you are both a WIDE and a WX station? Cyan?

A weather station also operating as a WIDE will display as green to indicate
that it is also a WIDE digi. Only problem is that you have to be sure to set
your BEACON command in the TNC to B E 20 or less! As long as your operation is
a stand-alone weather station/digi NOT using a computer (remote WX site) then
you're in good shape but a computer in the mix changes everything! The posit is
constantly being updated by the APRS software with the current synoptic data
from the WX unit, therefore while it is possible to make your alias WIDE the
icon will continue to show as BLUE!

Now, in the case of a normal digipeater you have two options. The preferred one
is to operate it as a WIDE-RELAY. By adding the -RELAY in the position report
(the BTEXT command) your star will fill in completely green. If you choose the
lessor option of being WIDE only, then the star will show as green with a white
center...
Hope that makes it a little clearer, Tony. BTW: How do you like the Blackjack
GPS Antenna I sold you????

Best 73,
Jim Duncan, KU0G

437. WB0WNX-7 Airmobile (Again)

From: Dave Kaplan <dkaplan@pionet.net>
Date: Tue, 20 Aug 1996 21:50:46 -0500
To: aprssig@tapr.org
Message-ID: <9608210250.AA03960@ELWOOD.pionet.net>
Rendered body type: text/plain

I will try airmobile once again on Saturday from Sioux City to Kansas
City/Downtown airport. Will depart SUX about 0730L to arrive MKC about
0845L. Will depart MKC about 1700L (or later if I get a free dinner) for
SUX. Pirpose of trip is to attend Fire/Rescue show at the Kansas City
Convention Center where I am displaying some of the items I sell to FEMA
USAR (Urban Search and Rescue) teams. Traveling with me is my sales
coordinator Gina (www.pionet.net/~dkaplan/gina.jpg) and her husband.

Setup is a Motorola PVT-6 to KPC-3 to Allinco DR1200 running 10 watts to w
rubber duck suction cupped to the copilot side window. Altitude should be
about 15,000 to 17,000 ft. Unit is set to only send $GPRMC. Should I be
sending anything else? Path is WIDE,GATE,GATE,WIDE. Full Duplex will be
turned on due to frequency saturation at that altitude.

Any comments or questions or even suggestions via E-Mail to dkaplan@pionet.net

Dave

> 4 buad rates that can be selected 1200, 4800, 9600, 19200. How do I
connect
> this GPS to the KPC-3 TNC?
> KA3TTU

ok, with the Garmin, the Orange is NMEA + and Black (or Bare) is BOTH
power - and NMEA -. The KPC-3 docs, in the GPS additional instructions,
tell you where to connect NMEA + and -. I'm at the office and don't have
access to a manual. Anyhoo, start with NMEA 0183A (as I am assuming that
the B and C will add other data) and see if the data is acceptable to
APRS. I use 9600 baud between the GPS and KPC-3 TNC. This doesn't seem to
matter much as I think the TNC has a buffer. I've used as low as 300 with
no problem.

Hope this helps!

APRSdos REPLY/COMMENT: Actually, you must use the words WIDE-RELAY at the
start of your POSIT comments to be green.  Since only dual alias
WIDE-RELAY digipeaters show as green.  WIDE only digipeaters are not
encouraged and will only show up as white with a green border..

==================================================================

Hello Dave,

I would be concerned about the location of the antenna.
We all know how well NASA's  works. hi
I believe several on the ssig are pilots that could help.
Personally I'd mount a full 1/4 wave outside possibly (down) on the wing
structure
with a swivel mount,  keeping it at least 2 feet away from any reflective
material.

Rendered body type: text/plain

APRS @ ALLUS
Several messages concerning HF freqs for APRS have been seen on the sig here lately, and this info was sent back in March of this year. Last weekedn tried some 20M & 17M tests with KD4EMI, but didn't work out too well.
Thought I would resend this info again for general info.

Here are some suggestions by George/W8FWF and in Readme files, now about two years old.

APRS HF FREQUENCIES OPERATIONS JAN 95

HF FREQS: MFJ/KAM	AEA'S	Mode	NORMAL USAGE
10.151	10.1515	LSB	Mostly East Coast so far (Calif late eves)
7.085	7.0855	Lsb	Mostly West Coast. (Ocassionaly now)
14.0963	14.0958	USB	Proposed new APRS DX Freq.

HERE ARE SOME OF THE APRS FREQUENCIES NOW IN USE ON THE LOW BANDS....
THE ENTRIES WITH (P) ARE NEWLY PRO0POSED FREQUENCIES STILL BEING TESTED..(By who?) Note the 14.0963 keeps APRS away from the 14.100 Intl BEACON freq.

ACTUAL XMIT FREQ.	MFJ/KAM DIAL (1700HZ TONE)	AEA DIAL (2210HZ TONE)
3583.3 KHZ (P)	3,585 KHZ (LSB)	3585.51 KHZ (LSB)
7083.3 KHZ	7,085 KHZ (LSB)	7085.51 KHZ (LSB)
10,149.3 KHZ	10,151 KHZ (LSB)	10,151.51 KHZ (LSB)
14,098 KHZ	14,096.3 KHZ (USB)	14,095.79 KHZ (USB)
18,098 KHZ (P)	18,096.3 KHZ (USB)	18,095.79 KHZ (USB)
21,098 KHZ (P)	21,006.3 KHZ (USB)	21,095.79 KHZ (USB)
24,928 KHZ (P)	24,926.3 KHZ (USB)	24,925.79 KHZ (USB)
28,098 KHZ (P)	28,096.3 KHZ (USB)	28,095.79 KHZ (USB)

(Note: the 24Meg freq may be in error, someone correct me if so)

==

The low bands will provide more activity and longer distances to the other station. While a VHF TNC works at 1200 bauds, on the Low Bands, you will need a TNC that will operate at a 300 baud rate. Several are available. Ideally, you should opt for a TNC that will allow for simultaneous operation (GATEWAY) on the low ands and also the VHF band. This allows you to link (GATE) the HF data from the HF band, down to the VHF side. To see the newmerous HF out of state APRS stations on your local VHF network band. (VHF 145.79/14501 & few others.)
Please read the HF.TXT file in the programs README.DIR. This will enlighten many on the HF to VHF only use of GATEWAY stations and GATE paths.
QSO among yourselves on testing the SUGGESTED frequencies, let the rest of us know. Am willing to help, need date,time (GMT) and freq and will give it a go OM..
73's & Enjoy, Bill/WB6LPG SanFran Bay Area 30M reliable GATEWAY station, on daily.. See Feb issue P45 of Cruising World for APRS for Yachting Hams. Off mexico more S/V appearing, QSO and encourage the Yachting World about APRS.

```
   Again let me know when/where and I'll run some tests with youall.

NNNN

WBB/WB6LPG

I guess this means I have to be a "member" of
TAPR, as I surmise there are thousands of
HAMS on this SIG, or am I too high on this
figure?  I see "group offer" alot, so that is what
I am guessing.

Maybe, since Stan Horzepa is on the SIG, he might use that
as a future article in QST, giving a rundown on the GPS
recievers that would be best suited for a beginner, and yet
be sufficient enough for APRS.  I use a KAM PLUS, with
a GPS reciever input on the back, so I am one step
closer to my ultimate APRS station.  :-)

Maybe with enough "newbie's" like myself, we may benefit
from those that have furthered APRS along the way....

APRSdos REPLY/COMMENT: Actually both. But I switched over from PACKET to
POSITION about 2 years ago, and made the change in most of my docs, but
forgot the LOGO screen until very recently! Argh... THese days I prefer
Automatic POSITION Reporting System but my trademark application requests
both... hi hi

458. THE SHIRT DESIGN IS DONE

From: KD4EMI@aol.com
Date: Wed, 21 Aug 1996 22:19:42 -0400
To: aprssig@tapr.org
Cc: APRS-FL@tapr.org
Message-ID: <960821221942_265620028@emout14.mail.aol.com>
Rendered body type: text/plain

The shirt design was changed slightly and will be finished on a week.
Then Final approval... (PACKET to POSITION)

Cost $20.00 for white with a pocket and collar. Single color logo.
This might vary by $1 or 2 bucks...depends on what I sell.

My first order will be 24 shirts.

They should be available within 2 weeks total. Enough time for the hamfest.
Thanks for the suggestions from everyone.
MIke
KD4eMI

459. How to get a shirt

From: KD4EMI@aol.com
Date: Wed, 21 Aug 1996 23:12:16 -0400
To: APRSSIG@tapr.org

Cc: APRS-FL@tapr.org
Message-ID: <960821231215_265667896@emout08.mail.aol.com>
Rendered body type: text/plain

```
Again, this is not for profit, just doing this to have fun..
The shirts will be available within a couple of weeks
Do you want one soon...?

The more orders I get now, will help me titrate how many to get.
If I get alot of orders I can buy more for hamfest etc etc...

So, to make it easy for our out of state (and IN-STATE) collegues

If you want a shirt, Send $21.00 to   (no tax , if you want more, send
appropriate amount)

Mike Kantor   KD4EMI
741 Lyons Road # 17204
Coconut Creek, FL 33063

You will recieve the shirt within 2 weeks tops..

Again it's polo with collar and pocket...White shirt.

Upper right breast is logo and above it
APRS
then the logo
Then
below it
AUTOMATED POSITION REPORTING SYSTEM
"We know where to find you"

The logo is a globe with sats around it.
Nothing on back.

The first order is for 24 shirts...Dont send cash...Pls send check.
Again, though I find it kinda distastefull to do this on the sig,
it's strictly for the comraderie that Im doing this, not to make a buck.
(I'll break even with 30 shirts)

Mike KD4EMI@AOL.COM
```

> We all know how well NASA's  works. hi

Pardon me while I take minor umbrage at this one (:-).

All things considered, the window antenna on SAREX works pretty well.  And,
having spent YEARS trying to help get something on the outside of the vehicle,
I don't foresee THAT getting much better in the future.  The antenna SAREX
uses approximates a 1/4 wave whip in pattern and gain.  The gotcha is that
this "whip" is virtually mounted on the side of the vehicle and not where a
clear view of earth is.  Of course, when you remember that the shuttle's
attitude is potentially _anything_ then location of the antenna at a fixed
point becomes problemattic.

> I believe several on the ssig are pilots that could help.

Dave's plan is a great start.  Having used a variety of handhelds from within
aircraft before, a taped-up antenna has real benefits.  I think it'll work
fine.

> Personally I'd mount a full 1/4 wave outside possibly (down) on the wing
```

> structure
> with a swivel mount, keeping it at least 2 feet away from any reflective
> material.

1. Too much work.
2. Too much PAPERWORK (FAA-337)

If I ever own my own plane, I intend to add 3 NMO mounts on the fuselage centerline. I can cap 'em when I don't ned them and use 'em when I do. One will have 2 meters on it full-time. One will have a UHF 1/4 wave. One will be "TBD" and changed as the mission dictates. Turns out that, worrying about shape, reflections from the aircraft, etc. are really not worth it for these applications.

I had my GPS antenna located within abt 8 inches from the steel whip of my multi-band mobile antenna with no adverse effects noted. However, I was hearing at abt an s-2 signal level the gps output which transmits every 2 seconds. I did eventually move the gps antenna to reduce the rcvd signal. It has been moved abt 8 feet away and can still be heard slightly but with no s-meter indication.

There are certain frequencies that are potential problems for L1 within both VHF and UHF spectrum. Drag out your calculator and see what you can come up with (hint: Figure 1542.72 as a center frequency for L1).

The power levels are high enough that you might see some interaction with the preamp in the PVT-6 antenna, if it's amplified. If you're using an OnCOre with the preamp at the receiver (passive antenna option) I saw no problems with the radio and GPS co-moounted within the Cow Box, and the antennas seperated by 6 inches (although I was only running 2 watts on the Cows...)

I have seen several GPS antennas with the preamp burned out from RF from a nearby transmitting antenna. Many modern antennas have filters to protect against this possibility. I'd read my antenna specs closely before keying the transmitter....

> PP-SEL-IA

I've just recently started building a Cozy Mark IV. For those of you who are not familiar, it is a 4 place (passenger), rear mounted engine, canard (little wing in the front) airplane. This one is all composite. The nice thing here is that I can do just about anything I want in "avionics" as I build the aircraft. The recomended antenna placement for the aeroplane is a 1/4 wave strip of copper foil built into the nose! This is placed in between the laminates of fiberglass and completely hidden. So, you can bet you bottom dollar there will be some Ham antenna built in various places of the plane! I fully intend on have a permenant installment of APRS gear as well as ATV. (I'd rather talk to hams than the FAA anyday) Anyhoo, I figure that 2 watts is all one would need. I've forgotten my formulas for signal distance to HAAT. Oh well, good luck witht he ARPS airmobile!

The rough calculation for line of sight to the horizon is:
distance (in miles) = 2 * square root of the height (in feet)
 or
distance (in miles) = square root (1.414 * height (in feet))
You can see the greatest change happens when you go from 0 to a few (hundred) feet. After that the distance doesn't change that much. A example would be when you are on a 1500 foot tower, the line of sight at the 1000 foot mark is ~42 miles, and at 1500 it is ~54 miles. The extra 500 feet only gets you an addition 10 miles.

Michael,

I think you have the 2 and the 1.414 reversed in the equations below...

Respondents.... to my query

Want to thank those who responded to my inquiry on uses of the Mic Encoder & Mim chip.

Dr. Sam/K3BY in Maryland using his for trackin while on his Walk America event, and am sure other such events.

Bob/WB4APR, using his and working fine, didn't say in what capacity, but still has few of the prototype kits available, ck him out for these and ideal small package for the experimentor.

Gywn/W1BEL, replied with info on his higher priorities, but will be giving us info later, thanks Gywn, keep me informed when available.

And Ted/KJ6ZJ, gave me info on STAMPS, small controller modules, two forms of "SIP's" and "DIP's" (wonder if he ment Chips & Dips) but for those interested on recent STAMP comments on the sig, you can look up the source "http://www.parallaxinc.com/stamp/index.htm" for further information.

Am sure there are more in use out in APRS land, how about our BALLOON chasers, and others , what, where, how and why, have you done with your Mic Encoders and MIM chips. Let the curious know,

****

NORCAL APRS UPDATE......

APRS going strong here in the San Francisco Bay area and Northern Calif. Have 20 some dedicated Hi/Low level Digipeters, lots of Mobile GPS tracking vehicles, aircraft, and we followed the SSS- Singlehanded Sailing Society, race from San Francisco to Hawaii first part of July, will be forwarding a HST disk to APR/Bob for inclusion on future APRS versions. Friend DDobbins/WH6YC, used to be copied on HF/10151/LSB from Hawaii, is now up in Seattle area and keep us informed on APRS activity in the great PNW (Pacific North West) Daily activity from San Diego and Southern Calif., copied on 30M, with several GPS trackers in that area.

Coming up in latter part of October, hope to track Rick/KN6KB on S/V Second Wind, from San FRancisco to San Diego, thence on the BAJA HA HA Sailboat race to Cabo San Lucas, over 100 S/V already signed up. Thence

Rick will go on down the Central America coast to Panama, and up through the Carrebeian to Florida during the winter months, so hopefully some HF GPS tracking of his travels.

Dave/WH6YC PACNWEST monthly Bulletin, a great idea for all areas , let us all know whats happening APRS wise, in different areas of the country and overseas.

APRS, TRY IT, YOU'LL LIKE IT.......

Thanks again all..
73's & Enjoy, Bill/WB6LPG@KA6EYH.#NOCAL.CA.USA.NOAM

I have my Garmin antenna mounted within a foot of my dual band (2m/440), about two feet from a 5/8 wave Larson 2m and about 4-5 feet from a 6m antenna. I have not noticed any problems with my Garmin 45 with this arrangement.

I am home until Sunday morning 24 Aug. Then I'll be on the way to Chicago. Don't have any dispatches yet for after unloading the Chicago tradeshow. Unfortunatley my vhf tcvr again has the same symptom as the last time it broke, 1 1/2 watts output. The tech last time said a solder joint broke. I wonder if his repair broke, I'll probably never know!

I am sorry that I don't answer all those that send me Aprs messages shile I am on the road. Please realize that I am on the go and sometimes may not stop for 5 hours. Therefore I am either out of your vhf net or the skip has changed or I just have moved to close or to far. If I have a small free time driving window I might then drive a 600 mile shift, or darn close to it depending upon which area of the USA I am in.

If someone can tell me which is the best 20 meter freq to use I will move to that freq when I get west of Texas. Or if anyone has any other ideas I'de probably give that a shot too!

I have had some wondeful experiences meeting Aprs-ers while on the road. KB0MQQ from the Denver, CO area first met me for breakfast, he only had coffee, then he and his wife picked me up that evening and treated me to supper at one of their favorite resturants. I must it admit the seafood plate was great!

In Chicago N9VHW picked me up and took me to a grocery store after we had our lunch. He surely made my extra time in Chicago pass quickly and enjoyably. I hope he'll get on Aprs "real time" so we can communicate and get to see each other again. I hope my 1 watt will get into their vhf network.

When ever I get to Amarillo, TX I find at least 1 and sometimes more Aprs-ers parked next to me at the truck stops even before I get settled in. I guess they use me as the fox for a fox hunt!

It was quite a surprise to me that I was going through Dayton during the hamfest. It worked out perfect for Sid, AA8JK, to talk me to a parking space a block away from the Aprs eyeball. Then I was swarmed with Aprs-ers whom were willing to taxi me to the eyeball. I am truely grateful I made that meeting. I suppose there were about 50 or more that attended.

W1GTT, someday we will have that eyeball. Perhaps now that school has started maybe we can teach your students some geography while I am truckin' the country.

There are many more that I hae met and many more that I have typed to as well as talked to while in your areas. I thank you all!

If all works out, I will be ordering another truck. I'll probably find another driver for the present one. The new one will have a custom sleeper much like what the interior of an RV is like. It'll be a "super truck" with more room room for more radio equipment. If it comes about I'll have N2CZF take somemore pix and put it on the Aprs-fl home page.

Looking forward to meeting more of you all....

73 - Peter w7lus

Mike you made a mistake in the formula.  It is

distance = square root of 2 times the height in feet

or

distance = 1.414 times square root of the height in feet

Here are my observations a first time with APRS in the car on a trip.
Setup consisted of KPC-3, Garmin 45 and Kenwood 240 (I think) at 45 watts
to a MFJ quarter wave on the roof.  All equipment was run from batteries
including the Kenwood.

Started from Dover, Delaware.  Lots of APRS activity especially from
Maryland around Wash, DC - Baltimore and in Pennasylvania near Philly.
This carried out to near Hagerstown MD then it dried up.  Freq was 145.79
- nothing that I could hear in western maryland and near Pittsburgh.
Nothing in Wheeling WV.  Nothing through most of OH until i got near
Columbus.  About 5-8 calls on my map.  A few calls in Dayton.  Nothing in
Indianapolis.  Activity near St. Louis - my final stop.  Same experience
on the way back.  I am thinking of a 30 or 12 meter HF radio now.  Need
more activity on my lap top (smile).

Sam K3BY - APRS is the neatest thing I have seen in ham radio in a long time.

485. Aeronautical Mobile

From: nickart@midtenn.net (Nicholas R. Smith)
Date: Fri, 23 Aug 1996 09:01:45 GMT
To: aprssig@tapr.org
Message-ID: <199608230901.JAA19610@sneezy.midtenn.net>
Rendered body type: text/plain

I have been reading about the station planning a trip using APRS aeronautical mobile. Since the 60's I have been using my 2 meter radio operating aeronautical mobile as well as operating HF when I was a pilot for a major airline (Eastern) before it finally went under. For those interested in this mode of operation I wrote an article for "QST" which they published in the January 1994 issue that tells of some of the great experiences I had while operating a "Hawker" corporate jet and operating packet.

The placement of the antenna inside the aircraft will give best results if it is mounted on the windows, or in some cases I have used the "MFJ" rollup antenna and placed it around the side windows or across the top of the instrument panel around the front wind screen. But of course like many of the respondents indicated, it is best to have an outside antenna and a good way of not having to mount an extra antenna is to have a radio shop or yourself connect a switch to go from a com that you don't use as much as the other, example if you use your #1 com mostly, then connect the transfer switch to the # 2 com and then run a coax with BNC were you normally put your 2 meter radio (I use an HT, 2-5 watts works great) and then you can switch from the #2 com to the HT when operating APRS, or just having some friendly QSO's (and you will get plenty if you call on 146.52).

I have operated on APRS in a Piper Lance, Mitsubishi MU-2, Cessna 340 and a Cessna Citation several times and the results are great at the higher altitudes. It seems that lots of folks are interested in Aeronautical Mobile so if you are in the south you may can see me September 2, 1996

around 12:00 noon departing Crossville, TN(my qth) and going to Melbourne,
FL which should take about 3 hours as I will be in a Cessna 340 which is not
very speedy. The return will be on September 3, around 5 PM and the route
will be direct Crossville, TN. Hope you are able to track me and I will
have my GateWay on at home QTH(HF 10.1515-AEA-145.79 2M). Then on September
13, 1996 I will be Aeronautical Mobile APRS to Peroia, IL to the ARRL
National Convention, but the departure time has not been determined at this
time and will announce that before the date.

Richard N2CZF and the rest of the APRS users, it's great that some of you have
web pages to do with APRS but PLEASE do not use the APRS Bulletin function as a
way to advertize it, specially on HF beaconing to VHF. I don't think that most
of us want to constantly see the little window on top spring up to see that
someone is wanting to tell me they have a web page on the net. A better way is
to put it in your btext (No flame, just asking).

hello,

The quip made about the location of the antenna on space shuttle was out
of line.
No matter where it is we are lucky to have ham equipment on board at all.
As to mounting the antenna outside I can understand, thought you might
be
flying in a lighter plane.

Its good to see all the feed back about antennas though.
Have a good trip and hope the venture is successful.
thanks,

Roger

488. remote wx stations

From: Kt4ll@aol.com
Date: Fri, 23 Aug 1996 11:46:20 -0400
To: aprssig@tapr.org
Message-ID: <960823114619_392272845@emout15.mail.aol.com>
Rendered body type: text/plain

I need to know from those of you who are running remote wx stations with a U-II and a KPC-3, how u have the tnc set up. We are having a problem here in Polk County, FLorida. Some stations are getting very high wind speed and temp readings, while others are getting normal readings from our remote wx stations. I am not sure if there is a problem in the way we have the tnc's set up or not.

```
gpshead 2 #
lt1 !xxxx.xxn/xxxxx.xxw_Polk Remote Wx Site
blt 1 every 00:05:00
blt 2 every 00:05:00
ltp 1 aprs via wide, wide
ltp 2 aprs via wide, wide
```

The stations that are getting the high values are running davis wx stations attached. I dont see why that would make a difference, but that is the only common denominator that I can find. One of these stations also has the same problem when N6OOA's remote comes through via a gate. Any body else having or heard of this happening?? Please let me know.

McDONNELL DOUGLAS
AIRCRAFT-SPACE SYSTEMS-MISSILES REGISTRATION CARD

Important! Important!

Please fill out and mail this card within 10 days of purchase.

Thank you for purchasing a McDonnell Douglas military aircraft. In order to protect your new investment, please take a few moments to fill out the warranty registration card below. Answering the survey questions is not required, but the information will help us to develop new products that best meet your needs and desires.

1. _Mr. _Mrs. _Ms. _Miss _Lt. _Gen. _Comrade _Classified _Other

First Name____________________Initial____Last
Name______________________

Latitude________________________Longitude_______________________________

Altitude________________________Password, Code Name,
Etc.__________________

2. Which model aircraft did you purchase?

F-14 Tomcat _F-15 Eagle _F-16 Falcon _F-19A Stealth _Classified

3. Date of purchase:
Month__________Day__________Year____________

4. Serial Number____________________

5. Please check where this product was purchased:

How do I connect the U-2000 to a KPC-3 digi? Anyone ever combined a remote WX station and digi? I have an APRS dedicated KPC-3 digi 40 miles away on a mountain and want to add the U-2000 to it. Will the symbol be a green star or a blue dot or will it change? How about a special blue star, Bob?

To: aprssig@tapr.org
Message-ID: <321E5E68.3767@ezl.com>
Rendered body type: text/plain

```
A local operator is having trouble setting up APRS with an AEA DSP 232
TNC.  He has read the read files and has not come up with a solution for
his problem.  The problem is that the program is not able to communicate
with the TNC.  The TNC works fine running a terminal program.

When setting up the program the user is asked for the TNC type.  The
DSP 232 is not one of the choices.  What choice should be made when
setting up the program for this TNC?  Any other hints anyone could offer
to help this operator set up APRS?

I will be unsubscribing to the sig late Saturday night as I am going out
of town for a week.  Please forward any replies directly to
lmiller@ezl.com.

Thanks in advance for any help....73

As per suggestions received I have added GPGGA to GPRMC to be transmitted.
GPRMC is sent every 30 seconds. GPGGA is sent every minute.  Full duplex is
on so I may trash some other packets (sorry...).  Path is
WIDE,GATE,GATE,WIDE.  Anybody capturing a track, I would appreciate a copy.

Departure from Sioux City (SUX) is 1000L.  Altitude is to be 17,000 ft.
Arrival at Kansas City Downtown (MKC) Executive Beechcraft is estimated at
1120L.

Departure from MKC will be sometime after 1700L at 16,000 ft.

Aircraft is a Piper Mojave N9232Y
```

I will be working at the Stanley Hydraulic Tool display at the Fire/Rescue show at the Kansas City Convention Center.

73, Dave

Here's your problem....

>lt1 !xxxx.xxn/xxxxx.xxw_Polk Remote Wx Site

You need to set your POSITION REPORT in BTEXT!!!  Erase LT1 and do this:

BTEXT !xxxx.xxN/xxxxx.xxW_Polk Co. Remote Wx Site.

Make sure you CAPITALIZE N and W!

Also set the normal UNPROTO path or Beacon/Posit won't go anywhere....Use what
you did for LTP1....

I have just been informed that the first 6M APRS Digi in Florida will be up in less than 1 week. We have had a commercial site and antenna offered to us and also all the fixings like a RADIO AND TNC!! I am planning to program up the TNC either Monday or Tuesday night so keep an eye out if you have 6M packet abilities.

Chances are that the station will be up by next weekend on 50.62 MHz. The station will be right on the Ocean in West Palm Beach and run probably 50W at 200ft on hardline. If you hear any packets please let me know at the address below. I will not be on myself for at least another week or so while I convert my commercial low-band radio to the ham bands and make up a new TNC cable.

Rendered body type: text/plain

```
If you live in South Florida (or maybe even national coverage!) try to keep
an eye out for possible coverage on APRS in your local news. Brothers to the
Rescue will be having a memorial flight for the lost pilots/amateurs that
were killed 6 months ago tomorow just outside of Cuban waters. Press
Releases were sent out and they hope to have a good turnout with the media.
Let's hope that we get the APRS system working down there in time for
takeoff! Ralph N4NEQ who is staying close to us this weekend, my wife Danea
N2RHU and myself are headed down to the hangar in a few hours to see if we
can get their system working properly.

Oh and of course keep an eye out on your APRS screen at about 10am for
aircraft if you live in South Florida over the SE waters of Dade and Monroe
county. Depending on WX conditions a WIDE digi will try to shadown the low
flying aircraft from about 5,000 ft to relay the positions back to Miami.
The aircraft will be using the standard SSID of -7 on their callsign, there
will be no computers on-board, just trackers so please to not increase the
traffic load with messages to the aircraft since they cannot respond.

Rendered body type: text/plain

```
Hi Gang-

I am looking for a radio for APRS Mobile only, want to run off own battery.
I am tossing up between an Alinco DR-130, DR-150, or yaesu FT-2200.  I have
been using a Yaesu FT-2500, just to big and not big on that mic plug,  Its
been awhile since I have owned an alinco, but if anyone has comments or
recommendations on these radio and working with packet, I would love to
hear.  I am steering towards 3 power levels, just cause of limited battery
power, sometimes 5 watts is not enough, 25 is good, 50 is much more of a drain.
I think one of the Alinco has a packet jack, is this a nice feature, I
personally have no problems wiring a connector for 8 pin din.
Ron

I think this SIG would benefit from a periodic posting of what is, and
is not appropriate for this list, as well as instructions on how to
unsubscribe. The alternative is to go to a moderated list, which the
majority have voted down. A moderated list slows down the timely exchange
of ideas, fixes, band openings, etc but it does solve the noise problem.

Bob - wd6dod

At 10:59 AM 8/24/96 -0500, you wrote:
>...as well as instructions on how to unsubscribe.

I subscribe to a list in which the method to unsubscribe is appended at the
```

end of ALL and EVERY message: we still get a couple of unsubscribe mails
sent to the list every week ....

Anyway if you don't know how to... here it is. It may be a good idea to save
this somewhere, just in case.

If you want to subscribe to the aprs mailing list you have to send a message
to the following address:

listproc@tapr.org

with, in the body of the e-mail the command:

subscribe aprssig <your name>

 (replace <your name> by your real name!)
If you have any other problem let me know, I'll try to help out.

For your information, here is a summary of the various command you can send
to the listprocessor:

```
>
>                          ListProcessor 6.0

I have post PLT&view.zip to ......aprssig/files/upload
Theree are tow programs here to view and plot ARPS maps.
the "plotter" is any laser or inkjet printer that supports HP-GL.
All hp laser jets beginniing with mod 3 support HP-GL
Later models of hp inket printers have this support. My inkjet does not
so plot map does not support color.
Happy map making Jack, kb4xf

Have a look at the following web address:

http://gauss.gge.unb.ca/grads/sunil/sgps.htm

This is a new web site that has a fairly thorough list of all GPS receivers in
space, including references to the recent shuttle GANE results and the Rex II
mission (which apparently is now using GPS for attitude determination). It also
lists many future missions that may use GPS. There is also a less detailed list
at our Small Satellite Home Page here at Surrey:

Rendered body type: text/plain

Hello, I am looking to set up APRS here in north central Pennsylvania. I am located in northern Lycoming county, about 15 miles south of Wellsboro, Tioga County. And I am interested in talking with some others in PA and NY about APRS in the area. I know that we don't have any in our area and others I have talked to welcome it. I would also like to know if the National Weather Service office in State College, PA does anything with APRS, I know they have two Hams on staff there, but I haven't talked to them as of yet. I may also need help setting the software up with my 232MBX, so stand by for those "How do you make this work" questions.

I am still reading the text files for APRS and hope to send the check out to register the software this week. Is there APRS software for Windows?

Thanks for reading and any help is greatly appreciated. I look forward to conversing all on the sig.

Dave, N3NXC

For those interested i have updated my APRS web page, it's to 3 pages now
so give me some feedback and if there's something more i should add (Or
delete Hi).
 By the way we have an upcomming Balloon launch Sept 8 it's not your
normal everyday balloon. In other words it's not one that will burst at a
given altitude but will decent to be used again. there will be a paylood
of APRS,GPS,Telemetry,ATV and more. It will also carry a portion of a
rocket control section, for a rocket to be launched 2 weeks after that.
This rocket fom what i understand will reach several miles in altitude.
I will keep the sig updated as to freq's and any other info i have. By
the way many of the payload functions will be controllable from the
ground.

Message-ID: <322015E7.5B86@epix.net>
Rendered body type: text/plain

Concept: Mutually beneficial GATEs between 6-Meters and 2-Meters

Hold on flamers... You know who you are!

First of all... are they in use? Since 2/6-Meter verticals are not very
expensive, and rigs for 6 are becoming increasingly easier to find, this
sounds like it may work with a GATE-able TNC.

Considerations: License of operators

Unlike HF GATEs it's still VHF to VHF

Comments: Okay flame if you must, but information, constructive
comments and criticism is all I'm looking for.

Hi

I sent this yesterday but haven't seen it appear on the sig, so have resent it. Apologies if it arrives
twice!

73 de bob

```
=====================================================================================================
=======
```

Hi Folks

I tend to altenate between dosAPRS and winAPRS according to how the mood takes me! I was running winAPRS
 1.1.2
for a couple of months (24 hrs/day) but found that when I got more than about 230 stations in the heard

```
list
then it crashed (usually every couple of days). So, I went back to dosAPRS 7.6f which has worked without
 a
crash for the 2 weeks. BTW both programs under win95.

I downloaded the latest version of winAPRS last night (v1.1.3) and found that it installed OK but it
didn't
read the temperature on my Ultimeter II. Read the wind speed/direction and rain gauges OK but not the
temp.
Went back to versions 1.1.2, 1.1.1 and 1.1.0 and they all worked OK as did dosAPRS. Anyone else seen
this?
Also, has anyone else noticed that winAPRS will not autostart (i.e. configure the TNC and open the
ports) with
win95 but will with Win 3.1/3/11? I have winAPRS on two win95 machines and neither will auto start, you
have to
go in and open the ports each time you start it. But, also have it on my laptop and machine at work and
they
both autostart as soon as you click on the icon!

For the record my main APRS machine is 486-DX4/80MHz, 8Mb RAM, bus mouse, com1=tnc, com2=wx station,
WIN95,
KAMPlus. (I know, I need more RAM!)

Thanks

Bob (G3ZFJ) asked about some weather problems in WinAPRS, especially in
version 1.1.3.

WinAPRS and MacAPRS (and DosAPRS to some extent) are going thru a LOT of
improvoments in the weather aspect...  Bob Bruninga and us (the Sproul Bros)
are also in the process of changing/improving the weather protocols..

Unfortunately, the temperature problem with the Ultimeter II slipped thru..
It will be fixed in the next release..

Since I've been somewhat involved in coordination off and on for about 20 years...

There are several things you need to do when looking to the local coordination body:

1. Note whether there might be a digital group who's working with the coordination group. If so, make contact with them and see what their particulars are. It's very possible that 145.79 is not a good frequency in your area, even if it's been used "for years" because of other allocations you might not be aware of. The local Packet folks working with the mainstream coordination group will have some feeling for this type of thing.

2. If no packet or digital group is working with the coordination folks, see if the local coordinator is "packet aware" and start off with a friendly chat about what you are doing and want to do.

3. Make sure you've done some serious frequency surveillence on 145.79 and some alternatives. You have to check for other modes, as some areas of the country have weak signal, translators and beacons in that range.

4. Don't go in with the "This is the National Frequency" speech primed and targeted. Further, falling back on the "ARRL Bandplan" probably won't endear you to the local coordination group. The League, for all it's done for amateur radio, does NOT do frequency coordination and their "bandplan" is little more than a suggestion, and not widely followed across the country.

5. My recommendation is to shoot for a statewide or regional (eg., larger than one state) frequency, if 145.79 is not available. Segregating APRS to a seperate channel in each city is counterproductive, as WE know, but others might not.

If it'll help, add my e-mail address as a "for more information" contact.

Hope this helps.

524. WINAPRS and PK-12

From: BordingK@aol.com
Date: Sun, 25 Aug 1996 11:32:18 -0400
To: aprssig@tapr.org
Message-ID: <960825113218_393481644@emout12.mail.aol.com>
Rendered body type: text/plain

1. I had WinAPRS 1.1.1 up and running pretty good, showing my QTH, my tracker and the few local APRS stations, but not with 1.1.2 and 1.1.3 I have all kinds of trouble talking to my PK-12 TNC.

a. PK-12 works great in windows terminal program and PackRat for Windows, but somehow the set-up is screwy now.

b. TNC buffer seems to hold all the incoming posits, because when I switch back to terminal from WinAPRS all the positis that have seemily stored up come in pouring out.

c.   WinAPRS TNC ini seem to have no effect on TNC.

d. Yes, headerline is off!

2. Anyone using WinAPRS with a PK-12 have any suggestions. Thanks in advance.

3. It's got to be something really simple, but so am I!

I am interested in getting a GARMIN-38   I have found one at a good price, (I think it's a good price) NEW
But I would like to know some things about it,   If any one could help me.

1. Will it work with the APRS program (v7.3d) ?

2. What is a good price on it ?

3. and any other good stuff about it, OR even the BAD?

Thanks! de John

526. Re: [APRSSIG:4002] winAPRS v1.1.3 Wx bug? (Resent)

From: schiers@ames.net
Date: Sun, 25 Aug 96 15:17:13 -0500
To: aprssig@tapr.org
Message-ID: <199608251538.KAA03352@tapr.org>
Rendered body type: text/plain

In <779079@bbs.ames.net>, on 08/25/96 at 08:47 AM,
aprssig@tapr.org said:

I was running winAPRS 1.1.2 for a couple of months (24 hrs/day) >but found that when I got more than about 230 stations in the heard list >then it crashed (usually every couple of days).

I have Win95 and 20mb ram with the dx2/80 and have noticed that if I have a lot of stations, or repeatedly load and unload large maps, etc...in

other words, with "heavy" use of the program, it slows to a crawl over a
period of a few days, and/or crashes.

>I downloaded the latest version of winAPRS last night (v1.1.3) and found
>that it installed OK but it didn't read the temperature on my Ultimeter
>II. Read the wind speed/direction and rain gauges OK but not the temp.

It works perfectly with the U-2000, albeit there are some protocol
problems that both Bob and the Bros. Sproul are working on.

 has anyone else noticed that
>winAPRS will not autostart (i.e. configure the TNC and open the ports)
>with win95

Don't know about 3.1, but autostart does not work with Win95.

>For the record my main APRS machine is 486-DX4/80MHz, 8Mb RAM, bus mouse,
>com1=tnc, com2=wx station, WIN95, KAMPlus. (I know, I need more RAM!)

I have 20mb ram and the problems you noted still happen. Either Win95
doesn't handle memory allocation very well, or WinAPRS has a memory leak.
Boy I wish we had APRS for OS/2...(whine/snivell) <g>

Hello everyone,
I have enjoyed watching the sig, and I have noticed that some questions
get more responses than others. I was talking to a fellow here in
Atlanta, that does not have e-mail access, and he wanted to see if there
was any discussion on making the APRS network 9600 before it gets to
large. I think he was primarily just thinking outloud, but I wanted to
post it anyways, and se ethe responses. Are there any plans to make APRS
9600 baud?

THis might be good in some instances where you got a GREAT 6M site but good
locations for 2M and need to connect two areas together. I have found that
6M is not as great as one would think for ground wave unless you have a good
ammount of power, good antenna, and a high location.

It may be a good place to test some ideas out. Anyone out there with a lot
of 6M FM expirience ? Also note that most TNC's will not do 1200 baud 1200
baud GATE operations. You will need a KPC-4, DSP-2232 or possibly a old
KPC-2 to do this.

Well my message was more geared towards other bands other than 2M. 145.79
was coordinated years ago by FADCA the state Digital Coordination
association. I think Florida was the 2nd state to do a statewide
coordination on .79.

I am thinking more of 6M, 220, 440, and 1.2 GHz, coordination will only get
worse as time goes on.

>Richard Garcia sez:

My Wp or something garbled the msg I posted..here is the jist of it..

ANDY, G0VUH in England has a node...He may be interested in APRS.

He will be on 10.151 LSB for a few tests..He has been able to copy
quite a few stations...

KB4FO, KP3EDL, W7LUS KR4VH KD1LY VE3NP K2MEB KB2LML
not KD4EMI    :(

See if you can connect to his node   (TIBET )
or leave a msg in his pbbs (G0VUH-3)

He has good hops thru EUROPE and Africa, as well as VHF link through
england..
Give it a shot..

I was able to connect to him and he has a strong signal. (with my MFJ loop
thats doing pretty good. Though I frequently make CW contacts with G0
stations on 30 M )

Lets cross the pond with APRS !

I like it, but there are not too many VHF/VHF gate-able TNCs on the
market.  I know that PacComm carries, or used to carry, one.

I am willing to try 6 meters from South Florida for a while.  Let us know
when the trial begins.

That's a move I'd sure support.  I'm migrating all the vehicle location apps
I'm doing (not APRS, but certainly using AX.25 and NMEA on non-amateur
frequencies) to 9600, and am getting good thru-puts.  Makes sence and
encourages good full-duplex operation in the long run, with regenerating
repeaters for the data, which ALSO help thru-put.

73, gerry

Trying to get a UHF frequency coordinated NOW for APRS on a statewide basis
shouldn't be too difficult in most states.  the gotcha is making a good case
for it, as defined by the coordinating body.  Whether they like APRS, OR
packet, won't matter as much if the case is compelling, in my experience.

No letter available here, BUT we had Kantronics on our side at the time that we
got 145.79 coordinated in Kansas.  Latest information that we have from the
Missouri people is that they see no need to coordinate the frequency since it is
a de facto standard already in Missouri and the surrounding states....I'm still
working on this one, though.

Around $200.00 at WalMart/KMart et al, BUT the GPS-45 can be had as low as
$249.00!!

>
>3. and any other good stuff about it,  OR even the BAD?

NO Extrenal antenna which makes it difficult to use with a stand-alone tracker,
inside the car or in other situations other than in full view of the sky.  Other
than that fact, they're nice units and the new GPS45-XL is the guts of the 38
with the detachable, external antenna standard with the 45!

RECOMMENDATION:  Spend the extra $50.00 and get the 45!!!

IMHO, 9600 baud is probably the wave of the future, BUT I think a wholesale
switchover to 9600 would most likely discourage potential APRS users who already
own 1200 baud equipment.  We see stations pop up on frequency from time to time
that are just monitoring and those that come up to 145.79 for a listen usually
get curious enough to load up the software and give it a try.  To that end, I
think we need to stay at 1200 and build up backbones on UHF at 9600!

One thing to keep in mind is that 1200 and 9600 baud cannot share the
same freq without collisions. All the 9600 modems I'am familiar with, use
state machine DCD.

> Considerations: License of operators
>
> Unlike HF GATEs it's still VHF to VHF

I don't know if this is what you were aiming at, but it's close enough
to the common question.

Back where I used to live, a club was operating a 10m FM repeater that
was crosslinked to a 440 repeater.  When the band was hot a few years
ago, several Techs used the 440 side and were having a blast working DX
on the 10m side.

Of course, every time they got on the system, the control ops would get
calls sating that techs were using the 10m repeater.

The bottom line is that the license class only applies to the
transmitter the licensee is operating.  In the event of a 2m-10 MHz
GATE, since only the General (or higher) licencee is transmitting on
10 MHz, it does not matter WHO is going through the GATE, as long as
they can legally transmit on 2m.

Rendered body type: text/plain
```

```
Can somebody help me?

We're trying to get WA9CJN-15 Wide-Relay to ALSO be a U-II WX station with a
raingauge.  Seems to me that I can get it to be a standalone WX station and
a Wide, but with the raingauge, it seems likely that the program has to run
to beacon out correct rain amounts, but that will mess up the Wide alias.
Hence ,even though I may put a Wide in the MYNode, it still won't show up on
screens as a Wide.

Equipment is a KPC-3 w/ Ver 6 firmware.

Thanks

That does not make a whole lot of sense to me at least. The reason to be
coordinated is to avoid any problems later on, yes I know many think that
even if coordinated it does not ammount to a hill of beans, that may be
possibly true in some areas.

All I can see is a large loop hole later on when someone get's on that has a
"friend",  even if you have been "unofficially coordinated" for years!

To: aprssig@tapr.org
Message-ID: <199608252133.RAA22288@grumpy.magg.net>
Rendered body type: text/plain

I agree on this point to no end. I think backbones are necessary to relieve the traffic on .79 due to the sometimes necessary use of multiple WIDEs to get to 2 different locations at the same time. I have mentioned this long ago while Tom W2VY was on the list here. I know that several people were helping him with some of the needs for APRS in ROSE code but al of the sudden he disappeared not to be heard.

In areas that have many many WIDES and a lot of users a backbone on 9600 baud will help to avoid the "folding back" of packets when someone goes over 2 WIDES in their path. If a digi could be made to repeat a packet using WIDE as normal and ALSO send that packet to UHF or above to all the other WIDES that are on the backbone then no one would have any excuse to even go WIDE,WIDE! The one other thing that is difficult is how will a packet on .79 going to WIDE and also the backbone get to all the distant WIDES on UHF ? I think that net/rom does automatic routing so this may be a way. I don't know how, it is not my speciality but I wonder if anyone else on the sig can help!

We may not need it today but at the rate many areas are growing I think someone that has the know how has got to start the project. It will not be very long at all and this does not seem to be a simple project!

Try telling that to the 5th smallest club in the Nation, which happens
to be the one I belong to... :-)

In all fairness, I maintain a node, and offer help in setting up APRS
to those that seem interested in APRS here, which is quite a chore
in itself... Imagine being quite popular on the voice repeaters... Which
does have it's benefits, nonetheless.   heh-heh!

How 'bout 8 times more capacity. 9600 should support 8 times as many users
as 1200 in the same bandwidth.

I think the way to interface the Backbones to the local Aprs is to strip the
headers of all packets sent to generic calls (ie not local qsos) and replace
them with a Header for the transport layer- then put another on when it pops
out the other side taylored for that local environment- I can do this with
BPQ code but it should be done in a stand-alone tnc- Ithink this is the
WIDE-N protocal Bob APR talks about-

All of this talk about coordijnation and I still would like to include a definitive list of statest that have an official coordinaton for APRS. I asked this once beofre, and got no responses. I wwill add the coordination info to my MAPS.TXT file Based on comments so far, Here is what I know:

Coordinated:
Kansas 145.79
Florida 145.79 WHAT part of Florida? South, middle or West?
Northern Calif (145.01)

I **THINK** that some of the following are coordinated, but have seeen no such confirming data...

Michigan
Ohio
Georgia
Maryyland
Alabama
New Jersey
Connecticut
Rhode Island
Masachussets
Virginia???
North Carolina?
Illinois?
IOWA?
Missouri?
Hawaii?
San DIego???

IF YOU CAN SAY TAHT THE APRS FREQWUENCY IS OFFICIALLY SANCTIONED, then please let me know...

Regarding the improvement in throughput possible on APRS, as soon as PacComm implements the WIDE-N digipeating algorithm, we should be able to see a 3 fold or more improvement in throughput and longer ranges for mobiles. Just count the number of dupes that you see in your network.. The WIDE-N algorithm will prevcent looping of RELAY,WIDE,WIDE packets.

Ive been talking about WIDE-N for two years now. Cant wait for PacComm to get around to doing something with it...

This is Ralph, N4NEQ.  I was working in Florida (Again!), and decided to
visit N2CZF near Miami ths weekend.  He and I drove down to Miami yesterday
and helped Louis, N4LDG get APRS going on a couple of aircraft that were
headed towards Cuba.

They were, of course, the "Brothers To The Rescue" group, who had 2 of their
planes shot down in International airspace by Castro's MIG-29s 6 months ago.

I took my digital camera and have posted an account of the trip, with
pictures on the Atlanta APRS Home Page.

The APRS worked well (must be all those Miami WIDES  ;)  ).

Please visit the page and let me know what you think of my work.

I also visited the Jupiter (FL) Loran transmitting station.  The guy there
is real interested in APRS now.  Let me know if you'd like to see these
pictures on the page as well.

I still have another very interesting, wild, APRS application with pictures
that I still have to write up, but I'll bet that every one of you saw the
results of it and didn't know it!

Ralph

Well all i can do is speak for the Northern part of Alabama. My digi is
coordinated for a 100 mile radius of it's position. The coordination body
checked with neighboring states, TN, MS, GA at the time of coordination. I
have the required paperwork!. As for the rest of the state i don't know.

Hi Bob:
To the best of my knowledge, Ohio does NOT officially coordinate packet
freqs. (and I hope they never do!)

This probably doesn't help you but its my $.02.

The Missouri Repeater Coordinator said that 145.79 MHz is de facto APRS in Missouri. Since no digital coordination is active in Missouri, I can safely say that we've logged 145.79 as a "coordinated" frequency.

Pretty much the same story in Iowa and Illinois from what I can see...

The newly-merged ARCC (Area Repeater Coordination Council) coordinates voice repeater frequencies in the ARRL sections of SNJ and EPA and is in the process of forming a digital committee but does not coordinate digital activity as of yet and it's thought that they may not do it at all. However, at this time, 145.79 is utilized by APRS exclusively in EPA and the entire state of NJ as a result of just being there since about 1992. That's when growth really spawned. In SNJ, we're seeing stations from NJ, PA, CT, NY, DE, MD and Northern VA as a result of properly spaced WIDE-RELAY or WIDE digis, so I guess one could say that APRS has such a foothold in all of these areas that real frequency coordination either isn't needed now or the frequency will be "assigned" to APRS by default if the coordinating bodies ever begin to coordinate digital activity.

Bob - APR - we were also told that Utah doesn't coordintate packet frequencies and we would have to do our own usage coordination. Salt Lake, Davis, Weber, and Utah Counties (80% of the population) are on 145.79 now, after the gracious consent of the few voice users there.

Bob and the rest of the WinAPRS users

I am responding to these comments so that everyone knows that I have read
them and am working on them.

```
Bug 1:  Crash on more than 230 (approximate) stations
        We have had this reported a couple of times and are investigating it
        I have not found anything yet but hope to have it fixed soon

Bug 2:  Ultimeter II weather reporting screw up in Version 1.1.3
        We have added a lot of new features including support for the Davis
        WX station and there is lots more to come. It is very possible
        we messed something up.  We should have this fixed ASAP

Bug 3:  Auto start (for auto open of serial ports)
        Auto start currently ONLY works on VHF TNC.  This has now been
        fixed and will be in the next release.
        I have it fully working on Win95 so I do not know what the problem is
        I have not been doing full testing on Win 3.1
```

Mark

> Missouri people is that they see no need to coordinate the frequency since it is
> a de facto standard already in Missouri and the surrounding states....I'm still
> working on this one, though.

And this is not a bad way to go.  As long as APRS activity doesn't interfere
with preexisting, AND COORDINATED, activity use of 145.79 as a defacto
standard frequency shouldn't be a problem.

I've heard two things persistently from the coordination world about this.
And some of the coordinators' complaint is valid, so don't get too mad right
off!

1.  "Those packet folks just grab any frequency they want, regardless of what
it's band-planned for."

and,
2.  Those APRS guys can't tell me UI've *GOT* to coordinate 145.769."

#1 is a valid complaint.  A lot of packet expansion has been ad hoc and
without the benefit of talking to anyone who spends much time playing with
making the bands usable for the largest group.

#2 has some validity as well.  If there's prior use, or if there's a specific
process to get a band segment redesignated, then the coordinator probably
CAN'T just designate a non-packet channel for APRS immediately.  And if it IS
a designated packet channel, then in most cases I'm familiar with, its use is
a free-for-all issue, and not a coordination issue.  In a lot of areas, packet
channel use is a matter of personal conscience and not planning.

Hope this helps,

73, gerry

Rendered body type: text/plain

```
Bob sez:

>Missouri?

Packet frequencies do not yet fall under coordination in Missouri, Bob. While
145.79 is "de facto" it is *not* officially coordinated and really can't be put
on your "good" list. However, we are in the throes of putting together a packet
coordination body; once some minor sticking points are either solved or
tip-toed around, we will have a formal coordination system.

Anyway, after yesterday's Missouri Repeater Council meeting we were chatting
about packet stuff and briefly mentioned the APRS freq. The coordinators were
in agreement that 5.79 certainly made sense and seemed to work where it was,
and nobody they were aware of had any problem with it.

If there's any solace to be had in this uncertainty, when the packet
coordination comes to be I'm fairly sure that 145.79 will be recognized.

And Steve sez:
```

>Ohio does NOT officially coordinate packet
>freqs. (and I hope they never do!)

This might be a tad short-sighted, Steve. History has firmly taught us that "gentlemen's agreements" fall apart when user populations increase beyond where everybody can know everybody on a face-to-face basis.

Rendered body type: text/plain

John sez:

>Could somebody 'splain to me what the benefits of using 9600 are? They have
>to be more reasons to switch than just 8 times faster xmission.

That alone is justification. The two specific reasons are:

1) 8X increase in user speed;
2) 6X (approx.) improvement in channel capacity.

Packet channel loading is a major problem in metropolitan areas. We seriously need to "raise the bar" in the packet community. 1200 is to packet as AM was to HF 20 years ago - yeah, a lot of people operate 1200, but it's wasteful of limited resources, and there is a much more efficient alternative readily available.

On a system with moderate loading, you don't get the full 8X improvement in capacity with 9600 due to collisions and the overhead of TXD.

FOOD FOR THOUGHT: With the interest in 70cm APRS still mostly at the discussion stage, I would like to encourage development of 9600 in concert with UHF. Since I have a tendency to put my money where my mouth is (a bad habit, according to my wife), the thoughts of a 9600 UHF APRS digi and a possible VHF/UHF gateway are not too far removed. Hmm... <insert thoughtful chin scratching>

> get curious enough to load up the software and give it a try. To that end, I
> think we need to stay at 1200 and build up backbones on UHF at 9600!

A wholesale switch may not happen overnight, either. A dual net, with encouragement for the "regulars" to migrate over, just might get others started thinking about it. If one were to broadcast RCM updates only on 9600, then there's more incentive to go there (I've not forgotten, Claude!).

I *do* think backbone and intercity linking development on non-APRS-mobile channels needs to be thought out and implemented at higher data rates, though, and I suspect THIS could be done over TCP/IP, and in conjunction with some of those activities, if a little thought were put to it.

1. It is the way I anticipate most pakcet operation ot go, over time.

2. 8x data rate, realizing about 6x performance improvement.

3. More time for RTCM DGPS correction transmissions.

4. Less time for collisions.

5. harder to screw up the radio-TNC interface, because it takes some snap or it doesn't work... You'd be surprised at the AFSK (1200 baud) signals I here around here that have been set up "by ear" and the occasional complaints that "It don't work!"

6. Improved recovery capability... You realize 6-10 dB SNR improvement with the G3RUH-type modem over AFSK systems.

583. Mac Mapping Program

From: Mike Musick <71301.3106@CompuServe.COM>
Date: 26 Aug 96 15:30:07 EDT
To: <aprssig@tapr.org>
Message-ID: <960826193006_71301.3106_FHJ48-1@CompuServe.COM>
Rendered body type: text/plain

Maps for the Rest of Us! ;-)

MacDLG v1.0 is now uploaded to the TAPR server. This is a Macintosh application which generates APRS maps in both the DOS and Mac/Win file formats.

Program features:

- Menu & dialog box control (looks and feels like a Mac program)
- User selection of file format, map features and finished size
- Point count reduction through use of related line joining
- Selectable smoothing for DOS points reduction
- Source data from USGS 100K DLG or Census Bureau TIGER databases, from either FTP or CD-ROM
- Logical use of color for feature identification
- Separate selection of shoreline, river, and stream detail
- Includes "trail" road types
- Tested with maps having 300,000 points
- Direct output of Mac/Win format - no conversion and its subsequent loss of resolution or color information

I've been working on this program for about four months and it appears to be solid enough to release now. It's a bit on the slow side for super-large maps (3 hours or more for 16-nMile radius maps of major metro areas which include all detail), but, after all, we're talking about 300-350K points to start with! If your expectations are kept reasonable, most maps should take 10-15 minutes to read and process on a mid-level Mac. I'm continuing to work on the speed issue, though.

While the program itself (I feel...) is straightforward to use, with clear dialog boxes and descriptive error messages, reading the manual is going to be mandatory to get any success. This is due to the unusual way (in Mac terms) in which the source files have to be organized in order to span the several files needed for even small maps. The manual is included with the application in MS Word 6.0 format; for those that don't have Word 6.0, the manual was also uploaded separately in PDF format.

The program is intended to give any Mac user the ability to generate his/her own maps for the various APRS programs.

Thanks are due to Jack Cavanagh, KB4XF, whose MKMAPHK2.BAS was the inspiration for MacDLG. My gratitude to Jack for making his code public.

Ron,
You might consider picking up a 200LX from someone unloading a package deal
on comp.sys.palmtops!  I see a nice deal there every now and then...

  You can purchase the serial cable a couple of different ways.  The first is
as part of the Connectivity Kit.  This kit includes some connectivity
software (there are shareware versions out there, too) and software that
runs the applications included with the 200 on your PC.  The Kit also
includes the serial cable and a package of various connectors for modems,
PCs and printers.  The Kit goes for around $50, I think.

  You can also purchase just the cable and connectors for around $30, as I
recall.

  Anyway, lurk around comp.sys.palmtops and you'll pick up a wealth of
information.  There's even a FAQ put out there regularly.  I wish I could
give you more information, but I'm sitting in the passenger terminal at the
airport :)

  BTW APRS runs just fine on the 200 (and I've heard the 100 is nearly equal
in this regard).  In fact, I now prefer using the palmtop APRS mobile for
public service events because the primary goal ther is for my location to
get out and into the net.   Being able to see everyone else's location on
the small display is secondary.  So, because of its size and power
requirement, it makes an ideal mobile APRS computer.

73 de Dan

It always helps to get there FIRST, too!  Once you're established on a frequency
Part 97 is very specific about interference.  Basically, it's a first come,
first served basis on frequency utilization.  We just happen to be lucky enough
around the midwest that nobody was already on 145.79 (except a couple of guys in
the St. Louis area who were, as reported, very cooperative when asked if they
would mind moving and had APRS and the national channel concept calmly and
rationally explained to them!).  To make a much-to-lengthy sentence short:  Get
there, Stay There and Be Nice About It!!!

Many years ago, well before APRS became popular a lot of bootleggers were on
145.79 in Miami. They are no longer there, I have not heard one on my
travels down there in the past 2 years. All you got to do is set up 3-4
WIDES in a "problem" area and sit back. <snicker>

Tom Eagle (K0JPR) and I were discussing implementing high-speed inter-lan work
with APRS yesterday. He is converting an existing high-profile digipeater in
central Missouri (uses ROSE switch software) to a dedicated APRS WIDE digi.
Seems to me that the Rose/TheNet/NetRom/Etc. code writers could implement some
sort of automatic linking feature for UI frames specific to APRS....

We threw around the idea (it got bent up a bit...) about a mobile operator
entering a new network area looking to establish tracking. Here's what we came
up with:

1) New User signs on to network by issuing Beacon and Posit on VHF.

2) Smart Network (Rose, etc.) recognizes a previously unheard/new station on
frequency (or one that has timed out!) and issues a one-time "networking notice"
to the new users terminal using one-liner message indicating they are tied into
the network and instructions for accessing the linking capabilities of the
network through a digi path setting.

Comments?

It is not really 8 times more users, although the user count could go
up.  We must include the overhead involved in sending packets, which
includes header and tailers on the packets themselves.  TXdelay is
shortened, which helps some, but the real user count goes up something
less than 8 times.  I am for all PACKET going in the direction of 9600
bps and faster.  I run 9600 through two rigs at home and really enjoy the
high throughput of data.

APRS77 has been under work for so long, that I sort of lost the bubble as to what all is new. Its time to get it out the door. Especially with the recently discovered bug with remote U-II's and stations with DAVIS instruments. I suggest that WX stations should get 77 and see if it does what I think. Then if it looks ok, everyone else can jump onboard. Its in tapr/SIG/files/upload. Also 76to77.zip is there also..

* New MAPFIX27.EXE cleans up some minor old glitches!
* Fixed DAVIS bug with remote U-II's
* Contains new WX parsing scheme for Natl Huricane Center
* Can now set WX-METRIC for KPH and Celsius formats
* Consolidated Prompt code to one subroutine. Hopefully transparent
* alt-S-OTHER-REDRAW can now set period independent of BEACON rate
* Increased L/P lists to 6 pages by eliminating the cabability to
  accept long L-LIST lines (used to accept up to 120 chars with line wrap)
* Added SPECIAL-RUNNER symbol ([). Changed BBS and TCPIP to B and I in
  circles.
* RV'w now show up when you do a JUST-MOBILES on the map or P-LIST

Hi Bob-- several things....
1) All of Fla is coordinated on 145.79.. As luck goes.. i had been on aprs about 2 weeks, when i went to the state wide freq coord meeting.. I had enuf insight that aprs was going to go well, so i brought it up and got it assigned by the state group.
There were several simplex repeter links on the freq at that time.. Now it is solid aprs...

2) There is goingg to be a bunch of Magellen 5000A gps units available soon..About $150... External detachable ant,data out, aircraft data base (all the airport identifiers), cig lighter plug (8-32 volts) or interrnal batts...The only draw back is the data string is the arnav string.. abcd lines...

Is therre any way to use this unit as a stand-alone tracker??? Can the kpc-3 be made to read the string????

3) when i got my old call back (W9ZGU), you sent me my changed val number (93800), but, you did not send my the new gps number... PLEASE?????
The old call was KA4OPZ....

4) It looks loke i am going to be aeonautical mobile from fla to mich to Ore.to Tulsa
to san antone,tex and back to fla... I will be 145.79, 25 watts with a rubber duck on the window...I will try to monitor 146.52 simplex, voice while i am airborne, on an h/t.This will be aprox 6 day trip.. i will put it out on tahe sig as soon as plans are firm.. It should be in a week or 10 days...

The new WX formats are for the MAP display. Using the command prefix WX-DISPLAY- you can select from several display options. These are displayed on the map in place of the station call...

```
   RAIN   Displays 2314/0.01"/987.6     Time/rain/baro
   WINDS  Displays 2314/035g040/987.6   time/winds/baro
   TEMPS  Displays 76'F/0.01"/987.6     Temp/rain/baro
   CALLS  Displays normal station call only
```

I added a GATES.BK which you can replay to see the HF gates of which I am aware. I know there are lots more out there, so send in your POSIT so I can add it to this file.

As usual if my DIGI-E, W, or SE.BK files do not show your area full time WIDE digis, send them to me too...

BUG REPORT: Argh, already found one. HEARD LOG doesn't reload from backup file!

Although this is self-serving on my part, I've found the perfect portable
computer to run mobile APRS, and that is the Dauphin DTR-1 (as seen on
comp.sys.palmtops!)

First they have an electroluminescent Mono VGA display which is highly
visible.  Second they run well off 12 volts DC directly.  Third, they are
small, about the size of a paperback almanac.  Fourth, they have a 9 pin
serial port buit in, so you don't have to buy a $100 "connectivity kit."
And fifth, it is a true PC compatible 486 computer that can run Windows.

Originally they sold new for about $2500, but used models go in the $400 to
$600 price range.  Sometimes you can find them for less, but not usually.

Here are some specs:
```

Cyrix 486 SLC 25 mHz processor
6 inch diagonal greyscale VGA display
Simultaneous display with desktop CRT (standard SVGA Port) 1 meg OAK SVGA adaptor built in
600 x 800 SVGA Color (or better possible) w/desktop CRT
40 meg HP "Kitty Hawk" HD (Low-Power Solid State replacement available from IBM)
Pen based or keyboard (Pen interface works well...done by Kurta)
Internal 2400/9600 data/fax modem
RJ45 Ethernet (optional)
4 meg static RAM standard upgradable to 6 meg
math co-processor option
floppy drive (on proprietary IDE port) (optional)

Weight w/o Portfolio Case and mini keyboard under 2.5 pounds!
9 x 5.5 x 1.25 inches w/o case or mini-keyboard!

Standard SVGA port, 9 pin serial port, 25 pin bi-directional printer port (yes It will run a Quick-Cam!),
PS2 keyboard port, RJ-11 modem port, and RJ-45 ethernet port (daughter card optional).

These are great for portable packet, Field Day, APRS. That's why I bought one. In fact, I tracked down and bought a "full-tilt" version because I liked the base model so much!

Here's what I'm selling:

One Base DTR-1 w/4 megs of RAM
Leather Portfolio Case
One DTR-1 NiMH battery (simple to roll your own replacement)
Mini-keyboard
Standard DTR-1 stylus
DTR-1 multi-volt AC adaptor/charger
DTR-1 manual
DOS 6.22 and Windows 3.11 preloaded
Laplink for DOS preloaded (use with any null-modem cable)

All in excellent condition.

$400 PPD COD anywhere in contiguous USA

I will consider offers or trades [radio equip., guns, a DF Jr. maybe :)]
The only flaw with this unit is that it is missing the slide cover for the display which has to be removed anyway to access the ports!

Peripherals such as the RAM upgrade, floppy drive, and ethernet card are still available from Surplus Technologies. I think the floppy drive is about $75 new.

If you don't buy it from me, this is a still a great little computer for APRS.

Mark Fellhauer - KC7BXS

Good questions, Roy. Hadn't thought about that aspect, but it may be safe to say that most people traveling with APRS far away are probably going to be using laptops in the car, I suspect. Seems that people running trackers tend to stay close to their home network...

But an answer lies in TNC programming: Why couldn't the TNC manufacturers (read TAPR coders) simply write in a respond-to-query option? The Kantronics units already will respond to some sort of WX query. It shouldn't be too hard to handle, but I would assume that the user would have to be able to configure how the TNC would handle the responses...

I'll think more about this whole idea and post more notes later this week.....

LOOK OUT CHICAGOLAND! Karla and I will be APRS mobile across northwest and northern Illinois and all of Iowa and NW Missouri beginning Friday, 1530 CDT.

Our itinerary looks like this:
FRIDAY
1530 departure from Burlington Jct., Mo.
1550 depart St. Joseph, Mo (eastward on U.S. 36)
1830 Hannibal, Mo (US 36 to I-36 in Illinois)
1930 Jacksonville, IL (dinner call at the Depot!)
2030 depart Jax for Springfield, IL (I-36 then I-55)
2200 arrive Bloomington/Normal (probable motel time)

SATURDAY
0800 Depart Bloomington for Chicago (I-55 northward)
1000 Arrive Elgin, IL
1100 Arrive Union, IL (Illinois RR Museum, ride trains, Jim has fun, Karla gets bored...)
1700 Motel in Elgin, IL then commuter train mobile (with APRS, probably a tracker only...) downtown.

Evening on the lakefront, north shore, etc....

SUNDAY

Back to the lakefront (APRS Commuter Rail Mobile)
The Art Museum (Karla looks at art, Jim gets bored)
Shedd Aquarium (Look at the Baluga whales! Aren't they cute?)

MORE ITINERARY AS IT GETS DECIDED!

Best 73,
Jim Duncan, KU0G

>"It don't work!"

Yes, and some TNC experts (and manufacturers) advocate setting levels by turning the deviation control up until you can't hear an increase and then backing off on it a bit. Not quite like setting it to the proper level at all.

The APRS-like system by ARNAV that I saw the FAA forcing helicopters to use during the Olympics was operating sucessfully at 9600 bps at 149 MHz , and they were tracking 110 moving aircraft, including sending them weather data.

I'd like to see a bit of 9.6 action on APRS myself. What type of method could we use to mix the traffic, but not the freqs? The GATE idea would require manual intervention (settings), wouldn't it?

I have written 3 replies to the Velez message and deleted every one of them before sending, until now.

Velez quoted something from a VERY VERY VERY OLD TOUNGE IN CHEEK MESSAGE I wrote a long time ago (it was a joke, folks- that's why the quotation marks were included):

>
\>>>Why would a MacAPRS user want to read an "inferior" DOS map anyway?
\>>>Are you saying it "should" read them? Or do you "need" to read
\>>>them. Or would you just "like" to read them. I think the point is
>>>"moot" (debatable)
>><SNIP>

And then added this insulting comment to it

>>
\>>Exactly. Let's stick to enhacing the programs we have at our disposal, ALL
\>>of them. Keep the personal jabs out of it...
>>
>

And then apologized (sort of) for replying to such an old message, which was taken out of context in the first place.

Then Mark saw all of it and wrote this:
>
>
\>MacAPRS and WinAPRS both completly handle dosAPRS maps, they just work. I
\>have seen some very nice DOS maps and they have there place even in
\>Mac/WinAPRS.
>
>

Which I agree with and was kidding about in the first place! As I recall, WinAPRS supported them from the time it left the gate (or right after). I am a registered user of both programs, even have the CD. I was making light of the fact that many users of one platform are always riding the users of whatever other platform there is. ie: Commodore 64 / TI-994A Mac/PC whatever.

As a matter-of-fact, I DIDN'T EVEN SAY THAT. Someone else quoted me on the first line and added the second part of his own, and then the person who brought it up again mistakenly attributed it all to me, thereby misquoting me.

Sorry for the bandwidth, but folks really should watch what they quote as not to misquote someone else.

Dan asks:

\>Please, could you tell the exact URL where it can be found?

Oops. I thought "everyone" <g!> knew about the "upload" area on the TAPR server. That's usually where you'll find new stuff. The URL is:

  ftp://ftp.tapr.org/tapr/SIG/aprssig/files/upload/MacDLG%201.0.sea.hqx

Occasionally new things are found in the categorized file areas, but that's normally only done by the folks who have broader privileges on the server than us mortals. We are understandably limited to the "upload" directory.

608. Arizona Digital Coordinator, etc.

From: Mark Fellhauer <sparkfel@primenet.com>
Date: Mon, 26 Aug 1996 22:48:43 -0700 (MST)
To: aprssig@tapr.org, aprssig@tapr.org
Message-ID: <1.5.4.16.19960826224907.09976978@mailhost.primenet.com>
Rendered body type: text/plain

I attended Ft. Tuthill's packet committee meeting this year and am pleased to announce that
Dan Meridith, N7MRP, is now the ARCA digital frequency coordinator. This should alleviate some of the problems we had with our last coordinator (who shall remain nameless) down in Tucson...who didn't like APRS. Dan has been an ally of APRS in the past. And he respectfully requests that you notify him before putting any digi's, nodes, etc. on the air.

Other good news in Arizona:

The ARA (Arizona Repeater Assoc.) is considering a valleywide (Phoenix) APRS digi on 145.79 (let's get them rolling!) It would be good to have the "big guns" of the ARA in our corner since they (we) have the sites, the equipment, the techs, and the $$. I am a member, and I encourage all central AZ hams to join the ARA. I think that it is still the largest repeater group in the U.S. Heck, what other RG offers so much, while asking for so little. Who else provides 5 open autopatches on 19 repeaters for 18 bucks a year! An APRS digi would be great since we left the 147.1 (+) experimental digital mode repeater. The binaries and RTTY were playing havoc with my APRS anyway...

The Thunderbird ARC has authorized funds to upgrade their 2 meter repeater. Improvements include a REAL antenna with real gain, a better power supply, and a better pre-amp and more tx power. This repeater is located on Phoenix General Hospital (Beardsley & I-17) on 145.43 (-). No PL for now. Future upgrades may include an open autopatch and APRS functions. Wednesday night net at 7:00 PM. As usual, check-ins get a free raffle ticket at the next general meeting. Note: last meeting I attended all prizes were won by people who checked in on the net, including me (g). This repeater is open to all. Voice and packet (for now) welcome.

Bad News in Arizona:

The ARA has taken the 9600 baud experimental digital mode repeater off-line...for now. This lead to a near shouting match at Ft. Tuthill. And came at a perfect time for me since I bought that Spirit-2 TNC! (Grrr...) Perhaps some complaining and a little tech help will get it back up. I hope so.

The Packet/Internet Gateway is still down, and will be until September or October.

The Dragonflye Charter School has had problems financially and with internal politics. Any plans for a ThunderBird ARC sponsered APRS Digi there are on indefinate hold. I'm still looking for a site!

Recent major storms have left Phoenix (and AZ) in a shambles. Many repeaters have been downed due to lightning and days w/o external power. Most of this happened while I was on vacation in South Dakota where the weather was excellent, so I missed the great power outage and the class 3 hurricane! In my 11 days in SoDak we had about 20 minutes of rain. I got up to Burqhardt's (sp?) Amateur Radio in Watertown. A ham radio store in a house, how odd. But a very good selection of used gear. South Dakota was a bust for me packetwise. My friend's apt. (KB0WSV) in Sioux Falls sits in an RF hole. I could hear faint packets but could copy none. It seems there is very little, if any APRS activity in Sioux Falls.

I did get a nice tour of the Midwest courtesy of Northwest Airlines on the way home. It seems they had some labor problems in Minneapolis, leaving me and about 1000 other people stranded in hotels there for the night. Again I had no luck with APRS, although it was past 11:00 pm when I got to the Airport Hilton. I did get in a little repeater monitoring though. The next day it was off to Chicago with an extensive layover in O'Hare. But not long enough to go anywhere in town -- I used to live in the Dearborn Market Building (2 E. 8th St.), so I know Chicago. Again no APRS activity. I finally got home to Phoenix after flying about 2000 miles out of my way. Northwest wanted to fly me through Memphis, on standby all the way! Heck I'd still be someplace else if I left it up to Northwest. I'm not sure where my luggage went, but it finally got back to me too.

And with today's heightened paranoia Airport-wise, it was a major hassle to carry on two DTR-1 computers, a scanner, a dual-band HT, several antennas, a TNC and other miscellaneous Ham equipment. Not to mention that KB0WSV sent me back with more gear than I came with! Every gate I went through I was met with the cry of "Hand Check!" by airport security! The DTR-1's did create quite a hit with all the guards though. Most had never seen a palmtop 486. Unpacking, powering up, and explaining all that gear was comical. Youda thunk they'd never seen a gear-head before. Heck they had the metal detectors cranked so high that the speedlaces on my hiking boots were setting them off.

Well, I've rambled on long enough.

Someplace in APRSSIG Digest 665 Hasan wrote:

> or WinAPRS has a memory leak.

no, but win 95 does:

(This came from one of those free tips that I get every morning)

SON OF MEMORY LEAK
http://www.microsoft.com/windows/software/krnlupd.htm
If you open and close a lot of programs -- especially ones that use Windows sockets like Internet applications -- you may experience a slow loss of available system memory in Windows 95. After hours of use, this problem can in some cases degrade performance or cause the system to go down (kinda makes you nostalgic for Windows 3.1 doesn't it?). The fix: upgrade your Kernel32 with the file dated April 1996, available for downloading from the Microsoft site.

John E Santmire wrote:

> 3. and any other good stuff about it, OR even the BAD?

John,

After reading some of the responses you've already received on the SIG, I just want to add that if you want to run the 38 from external power you must provide a regulated source of from 5 to 8 Vdc. The 45 will accept power from a source of from 5 to 40 Vdc, making it much simpler to plug into, say, a cigarette ligher in your vehicle...., or a 12V Gell Cell which is also powering your TNC and radio for a stand-alone tracker setup!

I purchased a GPS-45XL at a hamfest for $260.

Whichever one you decide to get I hope you enjoy it as much as I've been having a blast with mine!

Rendered body type: text/plain

Following solved one users problem between the GPS-20 and the DF-jr. The GPS-20 output is TRUE RS-232 levels not 0 and 5 as are most NMEA devices. SO in this case, he used a diode to pass only the positive excursions of the TRUE RS-232 so that it looked more like NMEA...

From: "Ralph R. Swick"<swick@x.org>

Out comes the 'scope (shoulda done this yesterday!) and Bob is (no surprise) right. GPS-45 is 0v to +5v, GPS-20 is -7.5v to +8v (not bad for +5 in!). A small-signal diode in the xmit line between the -20 and the DFjr fixes the problem very nicely. Tomorrow I'll build this diode into the DB-9 case on my DFjr multi-port adapter cable.

DFjr is now happily reading $GPRMC from the GPS-20.

Rendered body type: text/plain

I'm about to undertake the task of mounting a laptop computer in the car, and
would appreciate any comments about the "must dos" and "don't dos" that those
who have gone before have found.

Would like for the laptop to be easily accessible to both the driver and front
seat passenger (though not necessarily at the same time) and easy to install
and remove from the vehicle.

Car is a 1994 Chevy Caprice. Laptop is a TI 4000E. I already have a stack of
three radios located under the dash on the transmission hump, so that area is
probably out.

Any suggestions would be greatly appreciated.

Hi Bob,

Thanks for your assistance Bob.

We are getting ready to do a revision of the MPA with a nice DB-9/F to DB9/M
enclosure with a jack for the GPS,DFjr & PTT. Before we do this...do you have any
request? Looks like adding a diode with a jumper for "REAL" RS-232 data is necessary

Another subject, last nite I was out mobilin around and was unable to get the DFjr
bearing lines to show up on a DOSAPRS map, the GPS and PACKETS were fine. I followed all
the instruction in the readme/df.txt file to a "T", ALT-S-DF-DFjr, ALT-S-GPS-SPM,
ALT-S-SAVE-JDA, Also I kept hearing a blip! about every 2 seconds. I admit I'm very
rusty with DOSAPRS...it's been a while;-) Oh! Did I forget to mention...I was using the MPA.

PS-I lost my manual (again in the move), I need extra crimp pins & connector, where can I get
them kinda quick?

I mean for the Garmin GPS-20 board!

This was actualy meant for Bob directly, but I don't see any damage to the SIG here. Maybe
others can benefit too.

> (not bad for +5 in!).

The Garmin GPS 45 NMEA is *NOT* 0v and +5V (not all the time). When the GPS
45 is powered with 12v or more the NMEA output will rise to ~11v!

NMEA 0183 suggests (but doesn't require) that the signal complies with RS
422 (0 and 5v), but also specifies that any listener (device that receives
NMEA data) should be able to handle RS 422 *and* RS 232 (-12v to +12v) as
well. Previous NMEA norms specified RS232 as signal levels.

Be particularly careful when connecting a GPS 45 (and other GPS too) to a
microcontroller (stamp, PIC, 68HC11 ...) that can only take TTL levels!

Bernard, KB2TGH.

The DFjr uses a MAX232 chip to convert the GPS signal to TTL. The Garmin GPS-45
works ok, and the Garmin GPS-20 requires the diode. Someone else has a Trible
Scoutmaster (-9/+8.5v) and can't get that to work even with a diode.

No,  the MIM module's RS-232 connections already have transistors to invert the
RS-232 to the proper sense and limit the voltage to the PIC processor chip.  Serial
output from the MIM to your PC (for configuration purposes) is limited to 0-5v, but
this works fine.

```
There has been some discussion on using 6m radio to form APRS backbones.
But there is no easy way, until someone comes up with a level 4 routing
mechanism for UI packets.  But in the meantime, there is plenty of
potential for using such 6m/UHF crosslinks for remote access as follows:

You live in a valley.  Even though you have installed an APRS 2m WIDE on
top of the mountain, you only see X numbers of stations.  The only
stations you will see digipeated are those that still had an unused WIDE
in their paths.  Assuming no one is exceeding the recommended
WIDE,WIDE, you will see stations only 1 hop beyond your digi.

BUT your mountain WIDE DIGI IS SEEING lots of other APRS packets
that have already been digipeated twice (their LAST time).  If you simply
hooked the audio of the 2m-WIDE receiver to the audio transmitter on
UHF/6m, then on your valley radio on UHF/6m you would see all of those
packets TOO.  In other words, you use the 6m/UHF link as a crossband audio
repeater so you can hear EVERYTHING that can be heard on the mountain top,
not just those one-hop packets that will be digipeated by your WIDE.

In essence, you have just extended your RECEIVE range by another WIDE hop
in all directions. (In APRS, you normally have NO control over your
receive range, since paths are determined by the sender...)  Here you can
extend everyone in the valleys hearing range by a full hop!

Simiilar you are encouraged to NOT TRANSMIT beyond WIDE,WIDE.  Well,
again, put a 6m/UHF link into the 2m transmitter on the mountain,
and then your packets will go out from the mountaintop with the WIDE,WIDE
still intact, instead of using up one of them just to get to the mountain!

So This is where I see the first advantage to 6m and UHF.  The SNR on the
links must be very good to preserve the audio, but if done correctly, it
will give everyone with a UHF/6m scanner an additional DX receive
capability!  The transmit side is trickier, since you want to have DCD
active on the 2m freq so that your LINK packets dont collide...

We need some folks thinking about ways to use these other band
```

```
frequencies...

This is really strange!

There's no reason to use a diode as far as the MAX232 is concerned, it
should work with the GPS20 or the scoutmaster right away.
I have a data sheet for the MAX232 (actually the DS14C232, which is the
National semiconductor clone of it) in front of me:

The spec for the receiver input (which is the RS232 to TTL conversion part
of the MAX232) are:
-everything lower than 0.8V down to -25V is an input low (logical 1)
-everything higher than 2.6V up to +25V is an input high (logical 0).

This complies with the TIA/EIA-232-E norm, and should work perfectly with
all the kinds of NMEA signals out there.

Maybe the symptoms observed are related to something else?

-----

1996 ARRL and TAPR Digital Communications Conference
September 20-22, 1996
```

Seattle, Washington (minutes from SeaTac airport)

The 15th Annual ARRL and TAPR Digital Communications Conference is almost here. The 1996 ARRL and TAPR Digital Communications Conference will be held on September 20-22, 1996 in Seattle, Washington. This year's conference location is just minutes away from the SeaTac (Seattle/Tacoma) Airport.

Full information is available on TAPR Web Page http://www.tapr.org

The 1996 ARRL and TAPR Digital Communications Conference is co-hosted by the Puget Sound Amateur Radio TCP/IP Group and Boeing Employees Amateur Radio Society (BEARS).

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. The ARRL and TAPR Digital Communications Conference is for all levels of digital operators -- a must conference to attend to get active on a national level. Abstracts for the papers are now available on the TAPR web page.

The conference is not just for the digital expert. This year's conference will again provide an entire morning with beginning and intermediate presentations on selected topics in digital communications. Some of the topics will include: APRS, Satellite Communications, TCP/IP, Digital Radio, Spread Spectrum and other introductory topics. Come to the conference and hear these topics presented by the experts! Don't miss this opportunity to listen and talk to others in this area.

In addition to the presentation of papers on Friday and Saturday, three workshops will be held during the conference. Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. On Sunday, Dewayne Hendricks, WA8DZP , will conduct a workshop focusing on "How to utilize Part 15 wireless Radios for Ham Applications." A second Sunday workshop will focus on Wireless Networking using the WA4DSY 56K RF modem Technology.

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337, Tucson, AZ 85749-9399. Phone: (817) 383-0000. Fax: (817) 566-2544. Internet: tapr@tapr.org Web: www.tapr.org

Conference presentations, meetings, and workshops will be held at the Quality Inn Seattle Airport, a complex co-located with the Radisson Hotel Seattle Airport. When making reservations with the hotel, be sure to indicate you are attending the ARRL and TAPR DCC conference. The hotel provides transportation to and from SeaTac Airport. You should contact the hotel to arrange airport transportation.

Quality Inn Seattle Airport (conference hotel)
17101 Pacific Highway South, Seattle, WA, 98188

Try using a long flexible gooseneck type car phone mount. A piece of
plywood the size of your laptop and some velcro or elastic and your in
bbusiness.

I noticed yesterday, quite by accident, a strange event..
(with aprs ! )

I exitied the program,  then booted windows.

After I was done, I just loaded windows term to play with the tnc, and saw
that the unproto on my KAM was changed to RELAY on HF and VHF ?

I checked the inittapr and restore file.
No mention of relay at all ...
it seems as though  APRS changed my kam to relay, and I cant figure out why.
 I never had bothered to check it, Assumed it was fine. So I wonder, next
time you exit 76F, go to a terminal program, and check your unproto path to
see if it is ok..  Id like to figure out why this happened ?

Amen!  Although I did not use a 45 on the BTTR flight Saturday, the wide
voltage range of the Garmin 35 made it easy to run it on the 28 volt Cessna
337 power suystem.  Plugged right into the 28v cigarette lighter jack  and
worked fine!

Claude-

I have been looking for the same thing. I can offer that the mounts used in
a lot of Po-Lice cars is made be Gamber-Johnson. I hear it is expensive.

I think I am going to roll my own. My only advice is to support the top,
hinged part of the laptop so that hinge won't break!

Ralph

Thanks, Dick. Always happy to hear that it works for somebody other than me.
Programmer paranoia is fear of your code crashing and burning the moment you
let it loose.

>170k points with all
>selections chosen (a 10-mile radius centered on my Pasadena QTH)

Can you say "stress testing"? ;-)

For those of us who are interested in using MacDLG to catch up on some
long-desired mapping projects, you might want to hold off until the next
maintenance release. It turns out that what I thought was a "memo field" in the
internal Mac/Win file header is going to become very important, and the 1.0
release has this field wrong. On Keith Sproul's advice this has been corrected.

This problem does not affect the way the maps work now, but I wouldn't make a
big investment in a Mac/Win mapmaking project with MacDLG 1.0 because it is
likely that they won't work in future Mac/WinAPRS versions.

On the plus side, the next release of MacDLG will use a heretofore hidden
feature of MacAPRS, the ability to display thicker lines. This has already been
added to the development version, with Interstates, US and state highways
getting the "bold" treatment.

>Took 2 hours...

I had a bad case of publisher's remorse last night when an inspiration hit on
how to greatly improve optimization speed. I think I can get it down to well

```
under an hour for a map of 150-200K points. However, the maintenance release
correcting the "memo field" problem may have to come before the revised
optimizer is working.

Uh, would you (everyone on the list) please refrain from sending
binaries over the list?

MS-DOS binaries aren't terribly useful to those of us running Unix
systems.

In any case, there are quite a few people that don't trust virus
scanners (some don't trust executables in general) that come from
unknown sources.  There was a version of McAfee 'scan' floating around
some time ago that actually spread a virus.

[SNIP.... SNIP...]

Why do you say that?  Maxon, Micor, Mitrek, you name it,
is used for Amateur Radio because it does not fall
into the FCC Type Acceptance, unlike HAM radio gear,
which does, and therefore cannot be modified for other
uses besides ham radio.... CB just to name one off the
top of my head..

Without a radio (MAXON included), you cannot use
APRS "on-air".

647. Patch antenna/pre-amp

From: bob <w2g3zfj@unix.asb.com>
Date: Wed, 28 Aug 1996 08:09:41 -0400
To: aprssig@tapr.org
Message-ID: <199608281209.IAA18831@unix.asb.com>
Rendered body type: text/plain

Hi Folks

Thought you may be interested in this.

I found that my Magnavox MX4200's (GPS units) would not work reliably with the QST patch antenna. So, at the weekend, I made a simple pre-amp for it that seems to work very well. Now I can allways get lock, even with antenna on dash of car. Though its still not as good as my amplified Garmin antenna!

Details

Small piece (12mm square) fibleglass copperclad. Using exacto knife cut two lines across board and break in two places. Make a pad in same way for resistor/rf choke connection.

```
                ---------------------- ----
                |                    | |   | Join R/L at this pad
                |                    | |   |
                |                    |______
                ----------|------------------
                ________  | ____R___  ____L__
           Ant  ________--O-________C _______   To Rx
                          |
                ----------|------------------
                |                           |
                |                           |
                |                           |
                -----------------------------
```

I used a MAR 6 for the amplifier (Minicircuits) with a 100pf chip capacitor to isolate the output. Bias was via a 56 Ohm resistor and 3 turns on a ferrite bead to isolate the rf.

I then mounted this on the base of the patch antenna by soldering the small piece of pcb to the copper tape used for the ground connection. I made sure that the hole for the antenna connection was immediately adjacent to the input of the amplifier.

Seems to work! Although it does look a bit rough!

If anyones interested I will put more complete details on my aprs home page with a photo.

652. APRS L3 Networking (TexNet)

From: morganb@admin.inetport.com (Robert B. Morgan)
Date: Wed, 28 Aug 1996 09:38:43 -0500
To: aprssig@tapr.org
Message-ID: <199608281438.JAA22034@admin.inetport.com>
Rendered body type: text/plain

I am the individual that is doing the network code maintenance for TexNet, which is in active service in Texas and adjoining states, and is revised about once or twice a year. I am a relative newcomer to APRS, not even on the air yet (and waiting on a TAPR GPS order). I am very much interested in adding the necessary hooks to our code to transport APRS across the network for rebroadcast, and I am thinking along the lines of one idea in one of the digi text files, essentially having a mobile APRS add a destination "digi" address(es) to the tail end of the string which the network would recognize as a node(s) on the network, and then transport it and rebroadcast it. Before I jump off and start writing code, it would be appropriate to poll this SIG for the suggestions, do's and dont's. From some of the recent comments I have read, there is some interest in seeing APRS trunking happen. (And yes, TexNet runs 9600b trunks and they perform well most of the time).

I am rather limited on codespace, and constantly bump into the size limits, so the few functions added will have to be compact, and need to be very well chosen and thought out. So, also, I can't promise it will even happen just for this reason, but it looks like it would be very worthwhile to try. It also looks like it will probably be necessary to delve into the world of bankswitched EPROMS from here on out. (Another possible outcome of this development might be user EPROMs tailored to spotter's TNC's, but this isn't even a defined concept yet).

The TexNet code is presently being ported to TAPR's next TNC-??, whatever we decide to call it, and it is a pretty powerful little 2 or 4 port TNC. In fact, the first code to be executed in it was TexNet. Alpha testing and debugging continues, and I can't say when it will be out, so don't ask me THAT question. (Go bug Greg). But with two or four radio ports, and two async ports, it could be a very interesting mobile TNC with lots of APRS capability. Modems not included. You can choose from the whole range of available modems. While it hasn't been defined on the new TNC-?? yet, TexNet code now supports A/D conversion hardware, presently in the form of the 16 input ADC0817.

One of our primary interests in this area is severe weather alerting and spotting. TexNet grew up in Tornado Alley in Texas and Oklahoma, and it contains internal applications designed with these objectives in mind. One challenge on our horizon centers around the fact that the NWS has closed down quite a few forecast offices, and consolidated their geographical areas with others. It turns out that the radius of some of these NWS regions is now outrunning the radius of coverage of good wide-coverage voice repeaters, and this makes spotting coordination and reporting more difficult. Trunked APRS has the possibility of helping out with SOME of the problem. Toward this end I am investigating the possibility of putting APRS on spotters and linking them in some cases over a hundred miles back to NWS offices. Some more investigation is planned to develop mobile WX instrumentation that might be useful to spotters and meaningful to NWS whan radar screens get real busy and things get hectic, and I want to help develop both of these (the network code and the field instrumentation) more or less in parallel over the next year.

BTW, a discussion I had with one of the forecasters concerning mobile WX instrumentation uncovered the fact that the more useful parameters to report would be windspeed and direction and rainfall rate. To do wind direction on a spotter mobile will call for a magnetic compass input (or gyroscope!) as well as the GPS, since spotters park and turn around and this blows GPS heading data away.

There may also be some more map-making to be done in the next year or so. The useable goal for an APRS map in an NWS office would be to fairly closely resemble a NexRad display, which means that it has a county boundary background with optional roads, creeks and watersheds, along with some community center locations, and cover roughly the same regions as that of the radar sites. And nowadays, the NWS forecast offices often have to look at two or more NexRad sites to cover their territory.

Thanks in advance for useful suggestions, primarily on L3 APRS trunking, but also interested in mobile WX spotting applications comments.

It sounds like Bob B. needs to dig up his discussion regarding this "interference" issue with these Maxon radios. Apparently, these people haven't been following the SIG very long.

>>> John W Wilson <z004391b@bcfreenet.seflin.lib.fl.us> 28 Aug 96 05:04 >>>
I am finally seeing some sense on this thread. Maxon sells a 'transmit-only' radio, which has no place in amateur radio. The rules and regulations say that you will not interfere with another stations' transmission, and you can not 'listen' with a 'transmit-only' radio. You will, no doubt, be interfering with other stations if you use the Maxon, unless, of course, you intend to use a receiver with it.

Please avoid the use of 'transmit-only' stations, you will be a good ham neighbor and will remain within the rules and regulations of the FCC.

Better check out the 2m and 440 radios at your local Radio Shack.  Those
(along with the old 10m rig) are made by Maxon.

Just because a radio is not specifically designed for and exclusively
marketed to the Amateur market does not mean it's not a Ham radio.  One
of the "best" HF rigs on the market (from a reliability standpoint) -
from SGC - is primarily aimed at the maritime (ship) market.

If it's used at all on the Amateur freqs, it's a ham radio.

(To the person worried about a TX-only radio - the radio in question is
a two-way radio.)

Paul

```
A radio is a radio...  We should all be aware of "good deals" out there.
This was one of those "good deals" a couple of months ago.  The guy who had
them wanted to get rid of them.  Many wanted them and were/are great radios
for APRS or packet in general.  Big deal-NOT.

Not all the radios used in the Amateur Service are type accepted, only
those made by a manufacterer for sale.  Think about the homebrew and kit
radios out there.  Are they type accepted?  NO.  The FCC has allowed the
Amateur Radio licensees to design, build, and use anything they want.  The
operation of that radio falls under that persons license, who must meet
certian specifications/modes/bands/power as outlined in Part 97.

This subject is a NON-issue as far as I'm concerned.  Also, this is the
INTERNET and does NOT fall under "business" communications rules as
outlined for use of Amateur Radio frequencies.  However, I do understand
```

```
that SOME owners of Internet sites have put restrictions on what level of
"business" may be conducted on thier system for non-profit organizations.

"Talking" on this sig about makes of radios, any radio, and "good deals",
make this forum an interesting and thought provoking continual discussion
on one area of amateur radio (APRS) that we've all come together for.
There is a moderator of this Sig, I'm sure he or she will inform the group
if someone steps out of line.

Now people, just when ARE the Mic-Encoders going to be released to the
market place?  Any time tables?  I'm thinking small interface box with
three external connectors on it (GPS in/output, Speaker-Mic in/output, To
radio in/output), small push buttons on the outside for the short msg's
(like DTMF buttons on a regular mic), and maybe a 4th connector for power.
Or maybe even a Mic-Encoder with internal GPS receiver too...?  Mmm.

And come to think of it, I'll be needing a radio too... Anyone know of a
good radio for portable use? ;-)  Tounge firmly planted in cheek.

Cheers all, Bill Neal - N0NSA

Bob and the group,

Another "oddity" to consider is that I've had the mouse "leave" and
then "come back"!

Since I leave the APRS station up for days/weeks without rebooting,
I've become accustomed to losing the left mouse button.  But here
lately (since I upgraded to 7.6f?...), I've had full mouse
functionality return after several days/hours without it.  The cycle
might repeat itself over the course of several days/weeks...

So that you can (if you want...) attack the problem statistically, I
use a Compaq Prolinea 486/33, Microsoft MSDOS 6.22, a Microsoft mouse,
and Microsoft's MOUSE.COM version 8.20.  The mouse driver is "loaded
high" by AUTOEXEC.BAT on startup.

Absolutely right, Doug.  These people also seem to suffer from the
delusion that this forum is about ham radio, and that APRS is a
ham radio phenomenon, both of which are quite untrue.  I, along
with many others, use APRS primarily on non-ham frequencies,
and this discussion list is for APRS uses, not just ham radio ones.
To put it bluntly, even if something is illegal on ham radio, it may
still be completely appropriate here, because this *IS NOT* a
ham radio discussion group.

lets try again but not in a mime

Hi all I just got this program that will check for that virus that is
coming around on the internet. This virus checker is on the internet but I do
not know where. A friend of mime sent it to me, and I thought I would
send it on to you all.

I did not send the frist one in mime code so I do not know how it got that way.
As for the Mac or unix Sorry to you guys I work in PC-dos and I wish I did not
at Times. If you can not open this file Please let me know and I will send
you a copy by E-mail and last  if you do not have a good thing to say,
Please do not send it to me, I got hit by this thing and it was not good,
I only wish that some one did what I am doing and may be saved me a lot of
time putting my Computer back to where it would run again so Please no

Bob,

I know from my experience on the DMARC board that APRS is coordinated in their area of influence. This includes all of Maryland, the District of Columbia, and parts of Northern Virginia, West Virginia, and Southern Pennsylvania (approximately along the following lines: a few miles north of Richmond running E-W from the shore to about the ridgeline of the mountains west of Roanoake, then along the ridgeline Northward through parts of West Virginia and a few miles into the Southern part of Pennsylvania, then East to just below Philadelphia on the shoreline). The perimeter described is from memory; if you want a better or more accurate description it would be best for you to contact DMARC through it's new president, Stan Staten W3INK. You can drop him an email at 3WINKS@msn.com or W3INK@W3INK.MD on packet.

Paccomm sells a very small active GPS antenna for $50, it's a Trimble and it works perfect with the GPS-20, you just need to change the connector.

Here, here, thanks!

Since I lost the information from when the Maxons were for sale, I couldn't
answer these questions for myself. Here is my original question which asked
if there was any problems with them.

Original Message-------------------------------------------------------

Several months ago...there was a stream of conversations about Maxon
radios for sale. I have lost those conversations and wondered if anyone
has any info on them? or if anyone wants to get rid of theirs? Was there
any problems with them? etc...

End--------------------------------------------------------------------

I am a HAM interested in APRS and asked the SIG for help! if you can't help
then please don't reply!

Thanks!

> tail end of the path which the network would recognize...

APRSdos REPLY:  That idea still seems to be a good one.  THe only other
thing in the mill is that we may begin using WIDE-N digipeats which can
digipeat APRS packets outward radially N hops in all diretions without
duplication.   But still, that would be transparent to you, since any NODE
address would be after the WIDE-N,NODE so you could still route if you
recognize the NODE address no matter how many hops it took before that.

Message-ID: <199608281756.MAA16209@bulldog.afsc.k12.ar.us>
Rendered body type: text/plain

```
A radio brand name matters not, it's where, when and how you use it! I and
several others use the Maxon for very different reasons. I use a 10
channel handheld for Fire Service (153.815r) on one channel, First
Responder (155.550) on a channel, Amauter Radio (147.000r, 146.610r,
146.520) on other channels. The radio performs under some very extreme
circumstances. I have used it in the rain, dropped it, stepped on it, the
antenna was NEARLY melted off once (and it still transmitted!) and done
just about anything you'd not want to do to one. Still, the equipment
works. The handheld 10 and 16 channel, 3-5 watt is now strongly
recommended amoung the 8 VFD here in this county and the prefered HT for
us firefighters that must rely on ham bands every once in a while.

So, Joe and the Group, there is a bit about my experience with Maxons.
Hope it helps.

Are you the only one (well I built one too) having eventually built
something with the MAR-6?

I can't believe all the MAR-6 I distributed are still in their packages, :-).
I would like to hear about it, bas or good news! (For those new on the SIG,
I organized a group purchase for about 60 MAR-6 in june. Don't ask: I don't
have any of them left, and won't buy any more)

A complete description of my pre amp is on my web pages (hobby page,
MAR-6.pdf), it's a slightly improved and corrected version. I will post it
on the TAPRS site in a couple of days , as my web site is going down in 10 days.
Everybody can use , archive, distribute and/or put on their web page this
file. I would appreciate you cite the source, and give credit, though!

Regarding what Bob did: my experience is that the MAR-6 *needs* 50 ohms
impedance match at its input and output. My first prototype was "hand wired"
with junk box components ... it worked. The second prototype was on double
side PCB with strip line, SM caps : it worked way better! The double side
PCB is actually the ground plate of my QST patch antenna.

The 56 ohms value for the bias resistor seems a bit low, (calculation gives
about 100 ohms) unless there's already some resistance in the gps in series
with the 5V supply. The blocking cap on the antenna side of the MAR-6 is
effectively optional, if the antenna is not a DC shortcut.

Bernard, KB2TGH.

Could you make a map of the TexNet digi locations? I'd like to know if on
eis close. Might as well show radar sweep distance circles.

Hi Joe:

Mark WB0NOO in Nashville, TN had these radios for sale, I have one and
would like to say that it works very well.  If you need more info call me.

Hi Nicholas,

I appreciate the help. I am actualy trying to find someone who wants to get
rid of theirs.

If I do find one, then maybe I will need to contact you to find out how to
crystal and tune it for 145.790.

Thanks!

I have had two persons report that in 77, their OWN WX station fades to
gray after 2 hours. I have changed nothing since I last fixed this bug,
but this could occur if you have changed from local to zulu or from HF to
VHF and back recently... If you fade to gray, tell me
your PC time, your ZULU time, whether you are on HF or VHF, what is your
UTC offset, Are both the RECEIVED and ENTERED times being updated on the
PLIST, or just the RECEIVED?

I reported that my HEARD log was not being properly reloaded from a backup
file... It only occrured once, maybe I was imagining it... ANyone else
nail this one down?

Hi Joe,

I have 2 Maxon transmitters alreaddy crystaled and tuned for 145.78 MHz and
modified for hi power (~5 watts). I have since picked up some 25 watt 2m
mobile rigs and have taken the Maxon transmitters out of service. If you are
interested let me know. I would be interested in some kind of trade deal for
some of the things that you are working on. I have been considering
recrystaling them for use as hidden transmitters for Fox hunting.

Bruce

I picked up a couple of Radio Shack BTX-121 VHF transceivers cheap at a
hamfest recently for use in stand-alone trackers.  I've recrystalled them to
145.79, but the owners manual is worthless for details for retuning
instructions.  RH does not sell a tech manual to outsiders.

Anyone worked with these little radios and access to a tech manual or the
like?  Thanks in advance.

685. VIRUS and MAXON

From: KD4EMI@aol.com
Date: Wed, 28 Aug 1996 19:59:03 -0400
To: aprssig@tapr.org
Cc: DMOBLEY@encore.com
Message-ID: <960828195903_511932772@emout19.mail.aol.com>
Rendered body type: text/plain

```
Though I did not post a msg about either radio or virus, here are some
thoughts..

#1
Anyone who would download an unsolicited program sent my an unknown sig
member (sorry guy) deserves a virus...Why even bother sending it ?
If I wanted the program, I'd ask for it..(or better yet find a safe site to
get it )

#2
Though I enjoyed the little maxon thread,silliyness,  I just had to wonder
about who people think they are ??   Eg

#3  Dont TELL me what kind of radio I can or cant use  (try suggesting)
       Who died and made you the FCC ?
       Your expert opinion ...? I dont think so ...
        Even yours truly made a mistake (once), but the jerk that I
disagree'd with made such a baby out of himself, that nothing got resolved.

#2 Dont TELL me what is appropriate on a sig..
     Its your opinion and you know what body part opinons are
       most compared to..

     Diversity sometimes is welcome. (by some) Just cause it aint you..Tough
cookies..

I#3 Understand that YOUR interpretation of part 97, or whatever is strictly
       that !!
       YOUR INTERPRETATION !
Here is a refreshing thought.....CALM THE HELL DOWN !!

Why cant we all try SUGGESTING things, making points without offending nd
just try to all get along ?  Gees..guys..

How big a map can I make for winAPRS, macAPRS etc?
      If your map exceeds the dosAPRS limit of 3000 points it will be stored
with an extension of .dat    The size of this map is limited by an internal
array used to chain together the short segments that come off the CD.  The
array stores the beginning and end of each segment.  The limit is 3000
segments.  This probably limits mk100k to about 10000 points but I am just
guessing now.  This could be raised subject only to the base memory limit.  I
would hesitate to go much above 400k for the .exe file for fear of running
into problems with users with lots of TSR's.

Why doesn't program examine all dlg files for map data?

      You are limited to 100 files extracted from the CD.  I never thought
anyone would want to extract or download more than this at one time.  Move
excess files to another temporary directory.  They all can't contain data for
the maps under construction.   I could raise this to about 150 with ease.  I
could raise it more with a couple of hours of boring coding.

   MK100K was deveoped on a 286 with a single speed CD.  Boy, was it slow, but
I never would have figured out how to chain the short segments if I had not
been able to watch what was going on (agonizingly at times).

    I am going on a two week vacation to a place with no local call internet
acess.  I have unsubscribed from the sig until 16 Sep.

Rendered body type: text/plain

```
I have just spent a lot of time these past 2 days with a couple of my 6M
radios for APRS and I have a few thoughts.

1) Unless you have a dedicated radio and antenna 50.62 does not seem as
"tasty" as it once did.
```

A) You are going to have one heck! of a time making commercial radios cover both the normal repeater/simplex sub-band and 50.62 way down near the SSB portion.

B) After some thinking today about mounting the radio this weekend in the truck the antenna problem struck me. How are we going to get enough bandwidth in a normal mobile antenna to cover both the regular FM sub-band and 50.62 ?? Can't be done without high SWR

Now the radio part can be solved by either a amateur rig, (do they even go
down to 50.62??) that will be wide band or a dedicated radio (another box
for the car if you want voice also!). The antenna problem will require two
antennas cut for different portions of the band.

I spent countless of hours with replacing fixed caps with varactor diodes
and changing out caps to ones of lesser value but I had a LOT of help from
co-workers and some good test equipment (Uniden FTL Series 110W, stay away).
I think that this option is only for the brave. Even with all the hoops we
jumped we still only get 3 MHz from about 1.5 MHz of original bandwith. It
is enough but TOO much work and sensivity is still not great at the band edges.

I was ready to suggest 50.62 as a APRS frequency in FL this week to the
coordinators but am glad that I did not yet. 50.62 is not a great idea I
think for casual APRS use. We got to think of something else, I am open to
suggestions and want to act fast on this, been nuff' talk, time for some
action.

>have any of them left, and won't buy any more)
>

I built one exactly like the one you described, except for adding a couple of caps between the bias resistor and ground (for decoupling??). Since I don't have anything to compare it to, I don't know what to expect. I have it on the end of 12' of RG-8X cable plugged into a garmin-45, and it got a lock in 10 seconds on the first try.

I compared it to the supplied antenna, and found that although it will bring in the sats in the first ring real well, it doesn't seem to get the outside ones very well, when the supplied antenna will bring them all in. I thought it might just be a characteristic of the antenna design that it wouldn't pick up things low on the horizon, where the supplied antenna is more omni-directional.

I loaned it to a friend who has some GPS friendly test equipment where he works to see what he thinks of it - good or bad. I haven't heard back from him yet.

How about having a slimmed down version as Bob does with APRtrak just for
APRS. I understand space problems but is it possible to make a APRS Tex/Net
EEPROM just with the important stuff needed to do digipeating and trunking
for APRS systems.

I for one would be happy to help out on the testing if I can get others
interested in the area. 1st problem is that digi owners have been buying
KPC-3's and other "non clone" TNC's for digi's. I have mentioned this in the
past to many knowing that a special APRS EEPROM code would be necessary in
the near future but not many listened.

Here's a fairly simple one to answer(if I understand the question), The
TI-99/4A was built during the time that even the manufacturers seemed to
get confused as to which equipment was DTE(data terminal equip) or
DCE(data communication equip). To Simplify the answer--USE A NULL MODEM
ADAPTER on the serial port.
Hope that helps.

A person mentioned that he could find no record of Mr. Dent's Call.

A run through QRZ's database does indeed show that WA4MEJ is a valid call to
John W. Dent
out of Hilliard, FL. It's a general class ticket issued in 1990. Mr.
Dent's DOB is listed as 1930.

'nuff said?

I doubt Mr. Dent will post here again, or bother to reply to my (and
others...I'm sure) personal e-mail.

I do find it disturbing that someone who has enough knowledge to pass a
General Class exam can not even grasp the basic concepts of the spirit of
this sig or the fact that most commercial radio gear can (and has) been
converted to amateur radio use. His typing, grammar, and spelling combined
with his attitude can anly lead to one conclusion. Mr. Dent is suffering
from severe GOFS. (Grumpy Old Fart Syndrome) :)

Sorry but i don't think a moderator couldn't keep that off of here
either, the person sending it just won't read any of our messages, or
just doesn't have the brains to understand that nobody wants the file.
Gosh i sure hope that's the end of it.

  .......  SNIP........

  I agreed with all other comments except this. The specific virus software
noted here got downloaded by my mailer automatically. I neither asked for
it, wanted it, nor expected it. I resented an unknown user assuming
"everyone will want this" just because that person had a problem and got it
after the fact. It may be useful, I don't know, but sending it to the whole
SIG TWICE!! is not the way to do it.

  One could only imagine the flack here if Bob or Keith e-mailed every
version of their software via the SIG. After all, we all want it right :-}

Well Bill WA8INZ and Bob WD6DOD, I don't think we have to stand by and take this. Is there no way we can stop this? Like file a complaint about spamming the sig to his ISP? I know in the past, friends of mine have actually had other people's accounts pulled for repeated stuff like this. Or even better, everyone on the SIG make up a 1 meg binary and send it to this guy's mailbox, twice (at least). I think he'd get the idea after seeing the surcharges his ISP tacks on when his mailbox goes over its allotted space.

Has anyone out there actually decoded and run this thing to make sure it's what he says it is? If it is not, I'm sure we could get his account pulled.

I'm adding this one to my weenie file.

That's fine. I forgave you once, but after several people pointed out that
this was not proper on the SIG, I got the whole thing from you again. I
don't care if people leave the group because they have thin skins or don't
like confrontation. I've been on-line for 17 years now, and the nets are no
place for the squeamish.
You got flamed by us "idiots" for a good reason, you violated a basic rule
of netiquette. It's a legitimate gripe, despite your good intentions. I
have no way of knowing if the program I get from a stranger is good,
especially when it's mimed to me. I've been hit by a trojan horse once, as
have many people out there. There's no worse feeling than when a foreign
program wipes your C: Drive.

>
>WELL my hard DRIVE has been getting full of filles from someone is sending,

First, several people on the APRS SIG diplomatically pointed out that
sending binaries to the group is not considered proper behavior. I only
responded when after this was pointed out to you I again received this binary.

As for the stuff you are getting from MS-Email, I WOULD blast the guy if he
were doing it to me. IMHO, flames are a useful tool when they are well
deserved. And note, I sent my comments to you via personal e-mail and tried
not to belittle you on the SIG. Flames are only flames when made in public.
I did respond on the sig, but kept my comments fairly well contained.

>That was what I thought this group was about!

Usegroups are a much better place to put binaries or in a upload section on
a server. When in doubt, Ask first. Also, you didn't post an APRS file,
but a virus checker, this is not the virus checker SIG, it's the APRS SIG.
It's a discussion group, not a file swap group.

>
\>May all you flamers out there will think about that the next time you FLAME
\>some one that may be new and is just learning and HELP him in his MISTAKE!!!

Again, I refrained from flaming you on the SIG. I did make a comment about
about adding this to my weenie file, but I didn't go any farther than that.
>
\>Chris WB8YPO
\>one more gone

No one has asked you to leave, at least no one that I know of. And if
someone has, they have no right to. You are certainly welcome to stay, as I
hold no grudges. No one wants you to leave the APRS SIG, we just don't want
anymore binaries sent to us via that medium.

Heck, I've suffered the slings and arrows more than once from many people on
the boards and the net(s). It comes with the territory. I've pulled more
than a few bonehead moves on-line and been slammed for it. My advice to you
is to ride it out, and learn from your mistakes. This will blow over and
most people will have forgotten the whole incident by next week.

In the past a person who I was diametrically opposed to (and who I butted
heads with on many occasions) got himself kicked off FidoNet for his
vitriolic behavior and bible-thumping. I was the first to come to his
defense when that happened.

By all means stay.

Hi Ken;

>From 10 to 15 years ago, I had a bunch of RS computer
equipment and the same problem you speak of. After
stopping in dozens of RS stores across the country, I
found a clerk who was more familiar with RS's stock
numbering system. He showed me how to add a couple of
digits to the equipment stock number, to come up with the
manual stock number. After that I had no more trouble
getting repair manuals from RS. Unfortunately, all those
manuals and equipments, have gone on to other hands and I
don't remember what the additional characters were, but
keep looking and you will eventually find a store with a
clerk who can tell you how to do it.

regards,
Joe

Aw... come on gang. Let's drop all the name calling and grips. I'm in total
agreement with those that state that this is a APRS SIG only. Sure, there
have been
some "non" APRS msgs posted. Actually, most of the time, if you just ignore
them..
they go away. But, it's a little disconcerting to see posting with the
language from
our virus post authors. I guess they can't take constructive comments.
 I seldom comment. I just read those msgs that look interesting and delete
the rest.
But after seeing the flood of responses popping up in reference to the virus
msg, I had to delve into them. Maybe they meant well. But, not many of us
will download
files from unknown sources. Personally, my downloads go to another computer
for
expansion. It's only use in life is for that purpose along with a few minor
chores. My
main computer runs Vshield which watches for onboard viruses that may pop up.
  Back to the subject: Let's drop all the msgs and get back to the SIG
purpose.
That's all I have to add...   73'   Robert

>PISSOFF
>
>
  I ignored the file you sent the first time and didn't send you a message.

The 2nd time I replied to you directly not on the SIG. And I did specify why it's not appreciated to blindly send a file to all SIG members. I held my tongue and tried to get my point to you without flaming.

The message you replied to above was not a reply to you, and in part was a thought in general. You never posted 1st that you had a e-mail virus checking program and didn't ask if anyone was interested. And as far as I can remember, this was your first round of messages posted here to the SIG. I got blasted on my first set of messages too. My e-mailer at that time attached some junk at the end of every message I posted. I heard about it too.

If you take the above attitude because people don't appreciate your thoughfulness, I dont need your files or e-mail. Based on your comment I assume your new to the SIG and maybe even email. If that's the case, you have probably not been flamed too often or had too many people disagree with your thoughts or ideas. If this is the case, I suggest you grow a thicker skin and take your lumps along the way as you learn your way around.

If your not willing to do that.... don't go away mad, just go away.

If you can't understand why someone would get UPSET when an unknown individual sends you a file twice in an email with the word "VIRUS" in the title, you have a lot of learning to do. Now realize that multiplied many times because everyone in the SIG got your file twice.

Now as far as your "PISSOFF" comment..... Grow up, take a hike, get lost, you fill in the blank. You made the mistake, not me. I make plenty of my own without having to take credit for any one elses. If your not willing to learn from your mistake, take your attitude somewhere else ... it won't be missed.

I'm sorry to all SIG members for posting this here. But I did reply privately to this individual and was not trying to flame them with my previous statement. This is my last comment on this and probably the last to this person.

Rendered body type: text/plain

I too am sick and tired of receiving both unsolicited email through my provider, and having to sit and watch the auto download of stuff I'm very leary of off this SIG. I've privately emailed those who sent it, and asked them to stop. Others have gone public. Either way, I hope they get the message to stop the attachments. The right place, if there is such a thing, is in the APRS SIG UPLOADS area. Anyhow, the next time I receive such an unsolicted email, I've prepared a special zipped file of all my APRS maps (gotta keep it related, right?), about 3MB, and am just waiting to send it, as an attachment, back to whoever dares. May even send it 2-3 times. You know, I used to live in Hawaii, so this is where I'd say "Time to get back to the beach". Some of the old timers will remember. Now I'm in Seattle, so not yet sure what to say. Weather's been great lately. Hmmmmm. Aloha, Dave/WH6YC, PNW APRS Coordinator (MT-ID-WA-OR), 145.79, unsanctioned, uncoordinated, unsolicited, and understanding.

717. DFjr connections with APRS (fwd)

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 29 Aug 1996 10:41:27 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.960829103406.14105E-100000@arctic>
Rendered body type: text/plain

THe following commentor is right. We need a good concise writeup on how
to hook up the DFjr to APRS.. I am forwarding Roger's message to the sig
for the benefit of other DF'ers:

---------- Forwarded message ----------
From: Roger Sellers <rsellers@firecraker.com>

  I have the DFjr powered from Cig. plug, audio in from Audio out of a Icom
HT. Antenna connection is from the DFjr antenna to mj-45(?) antenna in on
DFjr. RS-232 out of DFjr goes to the MPA. I have a Garmin 45 connected to
the GPS-In plug on MPA. MPA has a DB9 out to a KPC-3 (no radio connected
yet) and DB9 out to COM1 on the laptop. The laptop can use a 2nd comm port
by way of a PCMCIA serial port card. But am not using it in trying to
utilize the SPM of the MPA (God I hate acrynms).

  I read the DF.txt in APRS77.zip and did the ALT-S-GPS-SPM and ALT-S-DFjr.
[We need a]... DFjr.txt file that deals just with how it's connected.
Anyway, last night trying it, I did get a DF signal to the screen. I could
even go to O-C-T and see the %XXX%X for position and quality(?). But today I
could not...

  Also, I did notice a problem with the APRS to DFjr interaction. It has to
do with relative orientation. I dont know if you've addressed this with the
GPS, but I cant tell since I cant get mine to work. Here's the problem as I
see it... [He discribed the fact that APRS needs to subtract the Vehicle
heading from the DF heading to get TRUE ...]

APR REPLY: Yes, we need a good writeup. but CONCISE. APRS should be
compensating for TRUE/RELATIVE. If not, lemme know... With all the
DFjr's out there, a good writeup will save a lot of aggrivation, hi hi...

APRSdos REPLY/COMMENT:  How does it work?   Here are the ways I think of.
Maybe we can use these definitions so that we all know what kind of
crossband system we are talking about during subsequent discussions.

GATEWAY:  Uses a MYGATE call.  Requires stations to specifically route
          via that MYGATE call.  For now, the MYGate call could be
          set to WIDE so that all 2m packets get gated.  But you still
          use up a WIDE getting onto and off of the 6m link...

AUDIO LINK:  Here you have the 6m radio serving as an audio cross band
              repeater.  Allows 6m stations to link into the 2m site
              without using up any hops.  But requires good signals and
              fast radios

PARALLEL:    You connect the 6m radio just like the 2m radio to the same
             TNC.  This way, every packet digipeated on 2m also goes out
             on 6m, every packet comming in on 6m can get digipeated onto
             2m.  This will work initially as long as channel loading is
             low, but with both receivers hooked to the same TNC, there
             will be audio collisions that reduce performance.

DUAL PARALLEL:  You have two TNC's so that each one listens to only trafic
             on its own channel, but then you wire the PTT and TNC XMT
             from each TNC to both radios so that all packets go out on
             both...  You can also wire the PTT of each to the CAR-DET
             so that their transmissions wont collide either...

OTHERS:  ANyone figured out any better ways?

I had my system all hooked up with the DFjr, GPS, Laptop and it worked ok from what i could tell. But thinking about this setup what advantage is there to running a GPS and Laptop with the DFjr unless your also planning to run a TNC and transmitter to beacon to the APRS network. Unless i'm missing something here why do i need this?.

Maybe what we need to do is start implementing a special gateway development based on tnc KISS mode - that way, the low level protocol issues can be resolved in software rather than having to look to tnc manufacturers. It works great with TCP/IP multiport nets, and although we don't have a network layer to guarantee routing and delivery, it would make the "tweaking" of the packet layer protocol more convenient. It would also allow the use of multiple tncs on a single machine.

The AX25 packet drivers already exist in the public domain in the NOS forums - unfortunately (fortunately?), they are written in C and would have to be ported.

721. Help With error '68'

From: Tom <epdkr@hurricane.net>
Date: Thu, 29 Aug 1996 09:08:50 -0700
To: aprssig@tapr.org
Message-ID: <199608291557.IAA29503@wind.hurricane.net>
Rendered body type: text/plain

For some reason unknown, I started recieving an error while trying to run APRS on my computer while in Windows. I'm hoping someone can help...

```
I have a P120 with 8MB RAM and run WIN95. After I start APRS, it loads,
does a little bit of work- then stops and announces 'ERROR 68' (this is modem
not found according to the info in the readme files).

All other programs, including TELIX (dos version), run fine. I have tried all
combinations of PIF settings and have not been successfuf at getting it to run
while in Windows- it **does** run in DOS however-

Any clues? Maybe this happened to you and you know the 'fix'....

Thanks in advance
73

In dealing with various mailing lists, in the past, I
have run across automated lists which attempted to solve
some of the problems we are having. I once saw an automated
server bounce any mesages larger than 10K and also
bounce any messages that have more quoted lines than
original lines. Does anyone know if the listserv at TAPR
has any of these capabilities?

regards,
Joe

Many times this because the user is accessing Web pages through a PROXY,
the proxy may then allow and/or restrict access to servers.  This is very
```

common inside of large orginazations. If you are accessing through a
provider, this should NOT be the case. AOL has its own proxy / caching
scheme.

I run APRS 7.7 from WIN 95. I do not use PIF file. The only thing you got
to do is create a shortcut in desktop from Windows explorer, drag your
APRS.EXE by pushing the left button into desktop and "voila" you are in
business.

Try calling 1-800-The-Shack

I have bought quite a bit from them in bulk (I mean BULK!) for work and it
may pay to go right to the horses mouth. Most of all the ordering I do (for
production) with radio shack is over the telephone, this way I avoid the
annoyed manager who is making $3.00 an hour plus commission. I do not blame
them sometimes, I have seen RS treat their people like trash!

OK, this is strike two. This is the second time this jerk has cluttered the list with 200k plus uploads to everyone (even though a large number of people have told him not to).

```
I think it's about time the list mom(s) get in the fray and start taking
action.  I think if we don't I'll follow the fine example and post to the
list a copy of each of the MacAPRS and WinAPRS archives (many megs apiece).
Perhaps that will wake someone up.

I've been lurking for a LONG time (since message numbers in the double
digits) and I've ignored many an off-topic flame session, but clogging my
mailbox with multi-minute downloads is flat unacceptable.

Come on, Keith, Bob, Mark, lets get a solution to this quick!!! before he
goes for try three at this stupid upload!

Now that I've got the crystals for my friend's new digi in Southwestern CT
(ya'll watch out down South now, he's WELL sited) he needs the parameters
for a KPC-3 TNC. Most of us here in CT would appreciate it if someone
having them would email him directly, not necessary to go through SIG for
this one, at:

KD1DU@aol.com

Thanks in advance.

739. Help w/Tiny-2/GPS Model

From: n2czf@magg.net (Richard Garcia)
Date: Thu, 29 Aug 1996 18:45:30 -0400
To: aprssig@tapr.org
Message-ID: <199608292245.SAA31082@grumpy.magg.net>
Rendered body type: text/plain

Louis n4ldg@juno.com is having a lot of problems getting a new tiny-2 with
built in GPS to work.

Louis did not get a manual with it today but whatever it is doing it is very
strange. The TNC will be in TNC mode not GPS and all he get's is "no source

callsign". He get's no CMD: prompt at all and has tried a hard reset. No junk on the screen either, it is not his speed that is the problem.

He did get CMD: once when he put the rear button on GPS, that does not make sense, it should have showed on TNC. But anyway even when he got one CMD: it did not accept any commands.

I do not own a TNY-2 so I can't help much, we have tried all the basic stuff, can anyone that owns one of these help him out ?? He is currently pulling his hair out since he has spent a week trying to get something to work right for once. You can contact him direct at n4ldg@juno.com or thru me and I will call him. He is located in Miami but I will flip the dime to finally get him with a working system.

EPROm version is 3.2.14 dated 8/23/96 This is quite recent so maybe it is a source code problem ? Does anyone else have this version of the new firmware ?

>APRS. I understand space problems but is it possible to make a APRS Tex/Net
>EEPROM just with the important stuff needed to do digipeating and trunking
>for APRS systems.
>

There's an idea. That one will go into the list. It's the message server code that is a little topheavy, and unless one can scrounge up the old WD disk controller (cp/m pre-IBMPC style) then it is excess baggqage in the EPROM.

>I for one would be happy to help out on the testing if I can get others
>interested in the area. 1st problem is that digi owners have been buying
>KPC-3's and other "non clone" TNC's for digi's. I have mentioned this in the
>past to many knowing that a special APRS EEPROM code would be necessary in
>the near future but not many listened.

I know, I have been pointing this out for years for all node apps.

The recent experience with the new TAPR TNC-??, which is running a Z180 and 8530-SCC (instead of the SIO/0) is giving TexNet the capability to handle generic Z80 code with either chip. (But not in the same TNC, it will be either / or). Pac-Com sold some TNC's that used the SCC instead of the SIO (I hava a dual-port unit someplace real deep in the pile that I am going to see if I can dredge up), and maybe there were others, so there is a POSSIBILITY that one more platform could be added to the repertoire of conditional assembly controls. I would be curious to know if there are a great number of these units out there in the field that folks might want to put into service. Since this code is pushing a megabyte of Z80 assembler sourcecode, I don't anticipate that there would be any likelyhood at all that it would ever be ported to anything non-Z80 compatible code. (now if one had a fast cheep 486 MS-DOS box (ugh), Z80MU might run it fast enough to be worthwhile, but what a kludge, and still not economical).

I don't recall if I mentioned it or not, but a version of TexNet for the good old TNC2 compatible will run 2 ports, although you lose the ASYNC terminal port, which is what one attaches a high speed modem to. That platform can be used for economical networking, provided you don't need async ports at remote locations (and the A/D converter is available in this device). We have one such node operating in a tower mounted cabinet several hundred feet up on a TV tower, and it is not accessible for casual maintenance. It has to survive for a few years at a time, and the A/D hardware is useful for troubleshooting. It certainly could acquire weather signal analogs, and logicals and pulses wouldn't be hard either. The TNC2 must have some minor surgery to a few traces to dual-port it, and the A/D converter daughtercard plugs into the extra memory socket, and needs maybe a few other leads run to the board to make it play, plus whatever inputs and conditioning is required for the application. That is the 16-input ADC.

```
Present software is capable of making mid-packet limiter, freq, etc
measurements and associating them with the received connect's callsign.
Haven't done UI's yet, but they are feasible, given the codespace!

And if you happen to know of suitable Z80+SCC units and also how the
memory and the I/O are mapped, let me know that too, or point me
in the direction, if there are enough in the field to make it worthwhile.

I am going to wait about a week, and roll all the replies into one
file and ack them.  Then we can make a second pass on the details, and
see where all this takes us.  Thanks to all who took the time to contribute,
and keep ideas coming.

Boy have I ever been flushing stuff to the bit-bucket in the last week!

Rendered body type: text/plain

```
Be aware that RS422 is a 'twisted' wire scheme where the wires are used
in a +5/-5 fashion (no ground) and the RS232 has a common ground with the
voltages on each seperate wire going from +9v to -9v.  With the RS422
scheme you must use RS422 receiver chips and each line must have a
terminating resistor of 50 ohms (I have seen 100 ohms).

TTL, of course, has the signals going from near 5v to near ground (+4v to
+.4v or so).  Ground is common.  Some RS232 stuff can work with TTL level
signals but it is not designed to do so.

Watch for a bulletin announcing the opening of a new Kansas City APRS Internet
presence!  We are in the process of getting the domain name of www.kcaprs.org
registered right now.

Here's what we're putting together....

JavAPRS site for the region

EMail access for KCAWG members

and everything you've always thought Internet could do for
APRS!!!

This is still in the planning stages but expect the domain to become active in
the next couple of weeks and the JavAPRS operation will begin almost immediately
after we go active...

T1 pipe and a DEAD HARD SERIOUS ISP to boot!!!

More later....

Best 73,
Jim Duncan, KU0G
APRS--Kansas City Coordinator

Granted, we spoke about that long ago on the ORIGINAL posting. But if one
were to connect a RX to the Maxxon TX what is the point on a 1 CH (or 2) 5W
radio at the price that it was sold for ? I know that ADI makes a "cheap"
handheld and mobile at the $189 price range that would do just fine and give
```

```
you a backup HT/Mobile if you ever need it. Without the trouble of ordering
crystals and tuning up the radio, not to mention fixing it to go to 5W.

I started with a DX-60  TX and HR-10B RX Heathkit for HF when I was 10 years
old, nice to think about but I am glad we are still not in the stone age! I
still do have the coaxial relay somewhere for the antenna switching...

I'm an old TI 99/4A software author  (Ever hear of the TIBBS  BBS back in
the 80's, I wrote it).  I didn't answer you before because I wasn't sure
what you were asking.  Sometimes we joke on here about the TI-99/4A version
of APRS   ;)

There are three ways to add a serial port:

The TI "sidecar plugin RS232" that is very hard to find.
The TI PEB (Peripheral Expansion Box) with an RS232 card inserted
Any of a couple 3rd party sidecar adapters.

You cannot add one yourself, because the peripherals on a TI were "smart".
```

If you can do newsgroups, try comp.sys.ti   It is a newsgroup for the
machine. If not, email me and I'll pose the question there for you.

Good luck

Ralph Fowler

I too have PM 2.o with the GPS option working.  I would love a way to use
this capability in APRS.

Welcome all comments.

For a person that NEVER could get the Single Port Adaptor working that I
bought from Paccomm (For a Paccom TNC) let me tell you that i didn't have any
problem at all making the DFjr work with APRS hooked to the GPS,Laptop
configuration. I will be the first one to praise the person that posts a
concise writeup like that, but as for me it was like Bill Gates said to all,
IT's Plug and Play.

754. SIG Sensory Overload, Solar Panel Battery Charging Questions

From: David Barrett <barrettd@crpl.cedar-rapids.lib.ia.us>
Date: Fri, 30 Aug 1996 06:10:47 -0500
To: aprssig@tapr.org
Message-ID: <199608301110.GAA24144@tapr.org>
Rendered body type: text/plain

Well everyone I hope I'm stepping in at a time wwhen the water is a little calmer on Lake APRS Sig. Kind of reminds me of an Iowa lake on saturday when it's 95° with 95% humidity. I have thoughtfully refrained from comment on some of what I read. I like avoiding foot in mouth complex, which I tend tohave a severe imunne deficiency to. I have some questions I'll get to as soon as I finish digressing.

The gems I've seen on the SIG so far have been the release of 77 and the MacDLG program as well as the TEXNET diiscussion. Keep those coming also I'm awaiting the announcement of the KC Web site change. Here in Iowa we seem to have a fulltime path from the Quad Cites all the way to Kansas City. Just recently there was an APRS bulleitn from KC looking for loaner KPC-3's and 2 meter HT's for the MS 150 event.

Now to my question! I have a Solarex SX-10 solar panel that I believe provides 5 watts at 13.8 volts. I'm in need of a curcuit that will allow me to charge a Gel Cell battery with out frying the battery. I know the curcuit componet values will depend on the amp rating of the Gel Cell I use. What I plan on doing is mounting an HTX-202, KPC-3, power distribution block and U2000 WX in a Hoffman SS NMEA 4 Box. The box will then be mounted along with the solar panel on a 150' water tower along with an Antenna Specialist 4 element Collinear antenna with East West lobes.

If anyone has any experience in this type of installation or just with the Solar Panel stuff, I'd love to hear from you. No matter what anyones say's or what ever type of language they use concerning this SIG; I find it to be a great source of innovation and inspiration.

Lest I forget I downloaded the latest WinAPRS and find it much improved, I figure another rev or three and I'll use it often enough to warrant registering. Hat's off to all the C programmers; I'll stick to Ladder Logic PLC programming and SCADA systems, it's all the pain and suffering I can bear; whatever happened to object oriented programming; you know click and drag, click and drag?

Sorry, this doggone reply button situation bit me again. A couple of private replies got posted. Nothing embarrassing, but still extra SIG noise,

Anyway, John Munsey wrote:

>Is it true that Precision Mapping ver 2.0, with the GPS option, can be used
>with APRS ?????

I use both PM with GPS and APRS. I have never seen a way to do it.

>
>If it is true how do you get APRS to bring the Precision Mapping maps up?
>

Not that I have seen!

APRS sort of works with "Streets On Disk", but it only will put a hooked object (from a sep. computer running APRS) onto your SOD screen. It makes SOD think the hooked station is a GPS position to SOD.

>I fear it is not true but hope it can be done.
>
>Please, any help will be appriceated as I need detailed maps of Florida.
>--

PM has that, but not for APRS. I have the best maps of FL I know of on my ftp site. follow my home page to my APRS page. www.mindspring.com/~rwf

A "FUTURE" version of WinAPRS might support Precision Mapping CD-ROM. I have the software SDK from the company and the docs to implement it. I am going to give it a try but it is not on the top of my priority list at the moment.

Until then, we have high detail (local street level) maps of ALL of Florida on the CD-ROM. These maps are compatible with MacAPRS and WinAPRS.

Mark

Rendered body type: text/plain

I went to West Marine and got a "Sun Selector " Solar Energy Control.
   M-8-12V

Most marine stores will have lots of GPS and solar devices.

The M-8-12V unit works on up to 60 volts DC input at 8 Amps.
There are 2 amp and 4 amp units M-2 and M-4 , if you want a smaller unit

Only 4 wires , The unit has 4 status leds
1. Ready
2. Analysing
3. Charging
4. Finished

The unit is a 2x2x1 in. potted module and works with Lead or Gel cells

Sun Selector number is 304-485-7150 (I don't remember the cost)

I used mine for field day battery charging with a variety of
solar racks .

I found that here in Texas in the summer the panel get VERY HOT during
the one hout it is pointed directly at the sun.

Just a quick note : Always use a regulator between a Solar panel and a
electronic device. A 12 Volt panel can output over 20 Volts in full
sunlight.

Here is a reprint from the March 1995 issue of QST, p. 114.

"If you need help, get on the Internet and join TAPR's APRS Special Interest Group (SIG).

TAPR has announced the formulation of an APRS Internet mailing list run by Keith Sproul, WU2Z, APRS programmer for Macintosh computers. APRS is a system used for tracking people, weather, objects, weather balloons and other objects.

This goal of this Special Interest Group (SIG) is to provide a forum for people interested in APRS so that they can ask questions, compare notes and exchange ideas. They'll discuss things pertaining to APRS, such as GPS, GPS units, applications of GPS and APRS (eg, automatic weather-reporting APRS used by hams who report the progress of hurricanes to the National Weather Service Hurricane Information Center in Miami),

```
using APRS in public events like bike-athons, and in emergencies.
        To subscribe to the APRS mailing list send a message to listserv@tapr.org
with the following line in the body of the message: subscribe aprssig
full_name where full_name is your complete first and last name.
        The author of APRS is ARRL Maryland/DC Section Technical Coordinator Bob
Bruninga, WB4APR, (410-553-6021) and the software is available on the ARRL
HQ BBS at 203-666-0578, in the Compuserve HAMNET library, and via
Internet, by anonymous FTP from several sites, including
oak.oakland.edu."

The answer was actually quite simple as suggested by "Jacques C. VOISIN"
```

<jvoisin@nebula.ispace.com>......

WIN95 does indeed create a PIF-type file everytime you run a DOS program
from WIN95.
The answer was to erase the DOS icon with the same file name as (in this
case) APRS77-
Did the trick- all is well now in AORS land- no more problems!! Somehow, I
had managed
to mangle the orgional PIF file- eliminating this file allowed a new one to
be created and
like I say, all is ok.

765. WX display formats

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 30 Aug 1996 17:59:00 -0400 (EDT)

To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.960830175153.1484D-100000@arctic>
Rendered body type: text/plain

```
I announced that APRS77 had three new display formats in place of
callsigns:

     TIME/rain/baro
     TIME/winds/baro
     TEMP/rain/baro

These had been done in accordance with a request form the Natl Hurrican
Center.  They had wanted TIME/Wind/gust/rain/baro which I modified because
it was just too long and would cover the map!

They now agree that the shorter format is better, but prefer that RAIN
show with the WIND instead of baro.  So in version 77a, I have turned it
all around again to these optional display formats:

      TIME/WIND/RAIN
      TIME/BARO/RAIN
      TEMP/RAIN

This serves the "severe" weather guys better, by giving them wind and rain
together, and shortens the TEMP/RAIN isplay to what most casual viewers
will want.  The wind is always displayed graphically anyway...

If anyone disagreees strongly, lemme know...
This is a local APRSdos display option and does not affect APRS on-air
formats...

Actually,  some of them were not confused, their lives were complicated by the
fact they manufactered true DCE and DTE devices ( a computer could technically
fall under either catagory depending upon the function that it was performing.)
TI, DEC, et al fell  into this category.  Neither IBM nor Apple had this problem
since IBM had opted to use its own `standards' prior to the IBM-PC and  Apple
```

had not made anything prior to the Apple II. It was market pressure (i.e., IBM/Apple compatability), not an end to alleged `confusion' re: DTE/DCE that has led to today's pseudo-standards. After all, a PC is neither a `true' DTE device (i.e., a teletype) nor a `true' DCE device (i.e., modem) although it can emulate either funcion.

More than enough said.

FWIW,

Doug   KC5RRZ

Hello I will be going to FL this weekend from Middle Ga. Our route will take us through Tampa on I-75. Our final destination is Ft. Myers. Then we'll be heading back on monday. APRS will be running while I am heading down there, hope to see those FL stations!

Everyone have a safe weekend.

For those who live in the Pacific Northwest, WA-OR-ID-MT......

There is a new home page I'd like you to check out- It's designed with you in mind.

The URL is http://hurricane.net/~epdkr/aprs.htm

This page is free and open to all APRS users to input information- I hope you'll participateand let me know what your needs, wants, and yes.... even complaints are. This is free- take advantage of it!! HIHI

73 and have a great weekend-

Tom, KC7DRX and Debbie, KC7FYA
        Bremerton WA

I got my PacComm single port adapter working on my laptop, but I had to put a 9v battery on it to do so. The laptop didn't have enough negative voltage on the RS232 line to satisfy the adapter.

The 9v battery lasts a month or so of daytime use.

I just got something like 30 orders today !!

I'll have to go to shirt dude and get some more...
The first batch should go into the mail
This Thursday...

PS we made a couple of changes and I wanted to credit the
APRS Ilinois group Web page creator for a neat logo.  I used some
aspects of it, and combined it with some others for a real professional look.
 Since there are so many orders now,  I dont have to worry about eating
shirts, so I will try to upgrade to 2 color  (no extra charge for you guys)
  OR perhaps add callsigns to the opposite  breast side of shirt..
Will see..

Thanks in advance for your support, Its been a labor of "like"
Mike

I'm in Rockford, Illinois and can see Quad Cities all the time. I've
recently been seeing stations in a west to south arc to KC. I can see this
path down to N0ZKK-3. I can also see to the east as far as around Detroit. I
think most of the guys in Chicago area can see them too. If this is the
case, I beleive we have 2 meters string for about 600 miles.
  Thats a lot of potential.

It *is* on the Internet,  I downloaded it.  It is a crippled (5 minute per
use) version, but upon evaluating it, I called them up and registered it
with a credit card. They gave me a number just like Bob does, that unlocked it.

I now have GA and FL maps downloaded to the laptop and use it frequently
with  *no CD* required.
```

Rich, N2CZF, has seen it operate and so have several of the Orlando APRSers.
The PM folks were very nice to me when I called.

The only thing I don't have for you is their web address. I think it is
www.justsoftworks.com

Rendered body type: text/plain

I just got off the plane on my trip back from Florida. We held a lot due to weather, so I had a chance to do something kind of neat:

I played with APRS on the Delta Jet. I also played with Precision Mapping/GPS.

I did not have a radio turned on, So I just played with the GPS and maps.

Here's what I did:

I had a Garmin Trackpack 35 PC (one of the 10 channel parallel receiver units that looks like a computer mouse) along with my laptop and a battery to run the GPS. It was the same GPS that was used on the BTTR plane last weekend.

The GPS was sending about 10 sentences once a second at 4800 bps, so I kept overloading the APRS comm buffer, but every other position came out ok.
I put the little bracket for the GPS in the plane window. It comes with a little radar detector type suction cup mount shelf. I received 3-4 satellites, but only got a 3D fix once (29,500 ft).

It was neat watching the plane zip along at 500 MPH. Heck, it was interesting just seeing the the speed that high in knots in the P list!

Needless to say, the other passengers in the immediate area got a kick out of it too. Especially when the pilot lied and said we were now heading to Atlanta (after a long hold over the LaGrange VOR) when we were actually somewhere in Alabama flying in circles.

I then booted up Precision Mapping/GPS. I never saw an altitude readout even with a 3 D fix (possible bug with large altitudes). It worked well and the others were real interested to see us zipping over the streets as I was zoomed in.

The Flight Attendants observed me and gave me no problems at all, but if they had- I was going to get them to check with the Pilot, telling him that a passenger/pilot was wanting to play with his GPS and PC.

Sure would have been fun to have used a rig up there, but I tend to respect those rules!

David,

Check out the article in the September QST entitled "The Micro M - a Miniature Charge Controller" on page 41. This may just be exactly what you're looking for: "a small charge controller using a single power MOSFET as a series switch. It can handle up to 2A of array current and is protected against overvoltage and reverse polarity."

In fact, this may be just the ticket to providing emergency power backup to WIDE digi's in lots of different kinds of installations!

Message-ID: <960831003719_191515125@emout07.mail.aol.com>
Rendered body type: text/plain

Hi APRSers -

Since we now have 3 storms in the Atlantic, it became real obvious that the naming scheme I had used in WXHURR3 didn't work! When you extracted positions on more than one storm and upload them to your local net, the forecast position "callsigns" were the same and would over write the other storm's forecast posits! KG5QD pointed this out, but I had been putting off making the change.

WXHURR4.ZIP is now at tapr.org:/tapr/SIG/aprssig/files/upload

This version helps correct the problem by adding the first letter of the storm's name as a prefix to the forecast position "callsign". Thus Eduardo's 02/1200 forecast posit is now named "E02/1200Z" and will not be confused with Fran, Gus, or any other Atlantic storm.

However.... if there is both a pacific and atlantic storm with the same first letter, the positions may get stolen. Hopefully that wont occur very often(?). Guess we will see.

Hope this little utility is of some use.

785. javAPRS Update

From: Steve Dimse <sdimse@bridge.net>
Date: Sat, 31 Aug 96 10:24:09 -0400
To: <aprssig@tapr.org>, <aprs-fl@tapr.org>
Message-ID: <199608311421.KAA14938@bridge.net>
Rendered body type: text/plain

```
Work on javAPRS continues. The latest feature added is the ability to
choose the map for viewing. Check out:

http://wa4dsy-3.wa4dsy.radio.org/Xaprs/soeast.html

http://www.bridge.net/~sdimse/trip.html

Also, for those of you interested in adding javAPRS to your web pages,
there is now a documentation file, although not yet complete.

http://www.bridge.net/~sdimse/javAPRSprog.html

786. APRS Queries

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 31 Aug 1996 11:41:53 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.960831102637.11528A-100000@arctic>
Rendered body type: text/plain

```
I am considering adding additional Query capabilities.  Our local
WIDE-RELAY went down (Navy took away power as they prepare to abandon 300
acres of antennas and demolish all 15 antennas 300, 600, 800 and 1200
foot tall, rather than be bothered with the income that they would produce
if leased to private companies...)

   So without a local WIDE (that is why my WEB site is no longer seeing
anything), I was trying to figure out what APRS neighbors could hear best,
to use them as a digi.  So I came up with a QUERY-DIRECT command that
would prompt my neighbors to send me a list of statinos that they could
hear direct...  Then I added a command to query a neighbor to ask his
station to send me his heard log for another station.  The repsonses come
back as messages to me.   So here are the approximate formats.  I am
waiting for concurence with Sproul Bros before releasing these in 77a...

QUERY to W4ABC RESPONSE
-------------- -------------------------------------------------------
Direct         A message to you:  Direct= W3XYZ, W3APC, WB4XYZ, WA$XYZ
Station W3ABC  A message to you:  Hrd W3ABC 14 12 16 45 13 22 27 19
               and a posit for W3ABC so he will show on your map

Oh, the Station Query can use wildcards like STATION WB4A  and it will
respond with a posit and heard message for all stations starting with
WB4A.  I will limit this tho, becasue I want to avoid any response that
takes a lot of channel capacity.

I also improved the general query to another station to allow selectivity.
You can query only his POSIT/STATUS, his MESSAGES, or his OBJECTS. RIght
now, you get them ALL which is overkill.

If the SIG has any other thoughts on what you might want to QUERY an
adjacent APRS station about, then lemme know...  Remember, I want it to be
BRIEF.  DOes the WX query work?  It has been defined since day one, but we
dont have enough WX stations in my area to test it with, and now without a
WIDE, I cant test it either...

>>seem to have a fulltime path from the Quad Cites all the way to Kansas City.
>>
>I'm in Rockford, Illinois and can see Quad Cities all the time. I've
>recently been seeing stations in a west to south arc to KC.

-------------------------------------------------------------------------
I'm in Madison, Wisconsin, and am seeing a lot of what Roger can see, from
the KC area, western & SE IA, a lot of N IL, and a bunch across the lake in
Michigan.  This is thanks to the multiple WIDE,WIDE,WIDE paths (although I
wonder what the WIDE collisions sound like locally!).  Plus, there's been a
band opening going here.

What would be nice when attempting to set up your own digipaths is to know
who can hear whom on a regular basis.  With the use of generic aliases, a
lot of times you don't know by which specific path a packet got to you.  I
would like to suggest some kind of mechanism where stations could post a
list of callsigns that they can hear (and hit) DIRECT so that others can
take advantage of them.  I don't think this SIG is the best place for
that...does anyone have any ideas?

I wonder if you can hear me direct, N3VEJ.   I've been trying out APRS, and
am having great fun with it, thanks to some tutorial from Rosie, N3IVO.

But how can I tell from a List who I am hearing direct and who I am hearing
from a repeat?

I saw precious little on my screen since yesterday, your wide up by
Perryville, you, WB3V and one other near you, and a wx at Perryville.
Otherwise, I saw a lot of PA & NJ.

What does it take to set up a WIDE?

     As a skywarn spotter, I'll put my two cents in by sugges-
ting that TEMP/WIND/RAIN or TEMP/GUST/RAIN might be more use-
ful in getting a better overview of regional conditions.  BTW,
we here in New York City ARES/RACES, as well as our colleagues
in Nassau and Suffolk counties are gearing up for the onslaught
of Hurricane Edouard.  I expect to be at my usual "tide-watch"
spot in one of our local low-lying areas and will have APRS
with me in the truck.  I'll be using it to keep our nets in-
formed of such weather data as APRS gives.  So it would be ap-
preciated if the information that's been uplinked earlier this
year with the other storms were to continue.  73 (glug-glug)

I'm in agreement on the suggested display of WX.  As SKYWARN coordinator for
West Texas and over 17 counties, we have had APRS up and running for nearly 1
year at the NWS.  Our first season this spring did not much use of it.
 However, I
expected this.  I felt it would be a test season in which we could get a good
look at
how it would benefit us.  With Les (N5KOA) here in Odessa, it's been helpful
to have
him work out some of the problems with his WX program and see the immediate
results.  One interesting quirk, or problem, recently noted.  I was at the
NWS visisting today and showing that particular shift the newest amateur WX
station down
in Alpine.  They noted that the barometer display was showing 20, which
didn't
figure into anything they could see.  However, a direct com connect to the
station (N5JOE) and running //WX (Les's program) displayed the correct info.
 What is the
map display telling us?
  I'm also interested in other SKYWARN coordinator's input and suggestions
and
what they've encountered in using APRS along with SKYWARN.
   Thanks,
                Robert   N5RKN

Hi all;
I've been doing some maps of the DFW area from the ftp site at USGS for the
DOS version...  But, I'd like to try my hand at better resolution with
WinAPRS.

So far I've not seen ANY documentation with WinAPRS on HOW to make a map
for this program.  Yes, I know you can use the same program (MK100 ect) I
currently use for DOS maps.  But, it usually dies about 1/3 of the way
through making a DOS map with the detail that I'm looking for.

Anyone have some direction for me?

Cheers, Bill Neal

First, maps made for dosAPRS work great in WinAPRS. Just copy them into the \WINAPRS\MAPS directory.

Second, using MKMAPxxx.exe, with the USGS DLG/Optional CDRom, I've been able to make fairly detailed maps for WinAPRS, that won't work with dosAPRS (because of the 3000 pt limit).

To see some, go to
http://tbcnet.com/~jleonard/n9vjq.htm

I want to pose another question to the sig and specially Bob on the legality of the OBJECT. I have a local weather station showing on the map as GHCC in this beacon or P list all it shows is the <C-5>. No indication other then the C-5 on who is transmitting this wx signal. Now i know who's station it is but others i'm sure are wondering. Of course part 97 is a legal document that i'm sure covers this somewhere but i can't find it. I think the explination for this WX station is that it's being transmitted as an object, but can an object actually be a transmitting site?.

In other words the way it's being done as i can see it that there's a transmitter at this site with no callsign, but to ID another station places an object at that site with the desicnation of <C-5> (An object).

I'm making maps for a specialized function, Search and Rescue. We follow
the 15" X 15" grid system that the US Government uses. Unfortunately, we
find ourselves looking for a lost person within a 5 mile area most of the
time.

Being able to tag/name areas and include ALL the data the USGS has for an
area is very helpful. This also allows us to make maps that have various
combo's of the USGS data for any situation. I've got the entire area
mapped for DOS APRS, but want to try out the WinAPRS for our mobile command
post. It'll have a high end microprocessor running a mini ethernet LAN, so
it could conceivably run WinAPRS without choking the LAN.

Also, running WinAPRS and having a map making function available for IT,
would enable us to make maps "on the fly" via cell phone and the Internet
when being stationed to a never before seen area before (yes I know I could
by the USGS CD, but why when the're updating next year?). Having an easy
one map does all would be nice as opposed to the many map with differing
levels of detail as in DOS... Or have I just inserted foot into mouth, by
saying WinAPRS does something it doesn't?

See, map making info would be real helpful so that I (and maybe others)
don't have to guess about capabilities and other stuff. That way I don't
get footus in da mouthus! Cheers y'all, Bill Neal / N0NSA

WinAPRS will take a DOS map, and go all the way to the furthest limits of
the map, in spite of where the border says it should be.  Also, WinAPRS
discards/ignores the border of the DOS map.

The only way that I've been able to fix this is to TASK-Trim the map in
question, saving everything that's relevant to the map, and discarding
everything else.

The area where I saw this most evident was when I was making a map for
Rockford IL, and then I TASK-Imported the water info from a USGS 2m map of
the county.  While DosAPRS loaded at the same border as before, WinAPRS
suddenly shot out to the extremes of the new map.  As the Rock River went
from up in WI to Lee County in the new map, that's where WinAPRS loaded it.
Trimming it fixed the problem.

See

http://tbcnet.com/~jleonard/n9vjq.htm

for a comparison of DosAPRS/WinAPRS using a DOS map.

 Gary I don't know why you don't see me on your screen. I see you all the
time. It is probably due to the digi or path I use. I am really confused
abaout the wide's and gate's and relay's. I run a 26 element beam with
over 100 watts and I aim it directly south quite often. Some evenings I get
4 or 5 pages of log. I save the large ones. If someone gave a class on this
APRS I would pay for it and drive a hundred miles to get to it. I'm picking
up bits and pieces here and there. But you should see me - darn it!. PS: In
answer to your query - don't change a thing. Everyone up here likes the mess-
ages and the screen plots the way they are.

Hi Ron, just read your message and felt i should put in my two cents Hi. It
may not be your station at all. A good example is my own station, i run a
pair of stacket 13B2's at abt 50 feet with a Mirage B 5030 G amp that's about
275 watt into those beams with the radio i'm running it with, yet there's one
digi about 80 miles away that i can hear direct that i cannot hit at all due
to all the intermod on that site, yet i can hit N4NEQ-3 that is 158 miles
away without any problem. The best all around path to use if in question is
WIDE,WIDE try not to use relay. Or look in your D list and see who is hitting
you direct by the * in front of the call. So you see them on the map and you
use WIDE,WIDE and they don't see you it's on their end not yours. Sorry for
butting in.

Could someone help me with a problem I am having..

I have another local station beaconing the following and I am not able to
see his station on my map the way he is listing it in his beacon..

N4FOR>BEACON,WIDE:!3204.67N/8105.70W#PHG5390/WIDE-RELAY/Connect to N4FOR-2
for message.

as I said I am not able to see this station on my local map, he is within a
couple of mile so me, and I can manually enter him onto my may.. I think
the reason he is not showing up with the info give above is because he has
left out the leading 0 in front of the 8105.70W location.  Am I right about
this or is there something I am doing wrong that is not allowing this
station to show up properly on my APRS map??

Thanks in advance for any help..

Don

I am adding a fourth page to my APRS webpage and here's what i would like to do. Those of you that are willing to help someone get started using APRS in your area, and can hit most of your local digi's in the town you live in then i would like to list your e-mail address so a newcommer after reading all about APRS on my web page can at least have someone to contact to help him get setup and on what and what not to do (Just your E-Mail address and the town and State your located in will do). I don't know if this is workable, but i'm willing to try. If you have it just give the Amsat.org address if you wish. I don't want to do this unless your willing to help a new APRS user in your town!.

> 73
> Ralph

Ralp,
What you did seemed pretty COOL, but it was illegal and dangerous!!!
As you obviously know, you may not use any receiver on board a commercial airplane (Federal Aviation Regulations). The pilot cannot even permit you to do it. A GPS is a receiver!! And you knew that!!
So what did you do when you were showboating for the other passengers ??
You could have endangered your and everybody elses lives, since it could have affected the onboard navigation system. Depending on the type of airplane you were in, some have OLD equipment. Be aware that in a holding pattern, the protected airspace around your aircraft is limited, and the pilots are expected to remain within. If they bust this, and it creates a conflict with another airplane, the pilots may have their license suspended for 30-90 days. That's a big fine (loss of income) for your showboating. Next time, if you are not sure, ask the pilot prior to using a receiver. Don't ask the flight attendant.

```
73.. Knut
Airline Captain

PS. If this had happened on my flight, I would have had you arrested for
endangering everbody's lifes.

I have been reading about acars w/aprs or APRSacars, Is there any info on
have this is setup?.
I have a PK900, aprs76f and a radio that can recieve 131.55 AM.
The PK900 does have software the will run acars. So I think the demodulator
is in the system.

I have tried just connecting the am radio to the second port of the pk900,
but how do I tell aprs the the second port is active?

During this last batch of map-making, the limits for maplist.CA was exceeded,
so I have split northern California off from the rest of the state!

norcal01.zip contains APRS maps for northern California, from a line from
about Monterey to the sierras. Included is MAPLIST.CAN which is the maplist
for these maps. This maplist also includes the larger area maps such as USA,
World, and regional California maps.

norcal01.zip can be found at tapr.org/tapr/SIG/aprssig/files/upload for now.

While I am in the questioning mood, I would like to find out if I have been
screwing up or not..

As I stated in a previous message, there are currently only two stations
operating aprs in the local Savannah area.. I am working hard to get more
people up and running with APRS.  One of the ways I have been doing this is
to uplink the recent hurricane reports every six hours of so thruout the
time that the hurricanes are a threat to the east coast.. Am I screwing up
something by doing this.. I have recieved no complaints from anyone, but
this could be beacause there is nor near enough to be bother by me doing
this..   Is it ok to uplink this kind of weather information if a station
like me does not see in already on their APRS maps..

Thanks in advance for your replys..

Hello all,

I'll be taking APRS for a ride from New York City to Washington DC on Friday, October 4th (after I get home from work) and returning Sunday the 6th (again, late afternoon or evening) and am wondering if the best path to set for the trip would be "RELAY,WIDE,WIDE" or to just leave out the RELAY. Yes, I know that a WIDE digipeater should also have an alternate alias of RELAY, but am also aware that not all TNC's support this.

I'll probably be taking I-95 (or one of the parallel roads like US-1) all the way to the Beltway. Mobile setup is as follows:

Toshiba Satellite 105 computer (the co-pilot),
PicoPacket w/built-in Trimble SV-6 GPS,
Yaesu FT-530 H-T,
rfConcepts rfc-270g Amp (might need the extra juice!),
ANLI AL-800 Telescopic whip,
Yaesu FT-5100 Mobile rig,
Diamond SG-7900 mobile whip.

The '5100 & '7900 will be for voice. If you see N2ZRC-12, try suggesting a repeater in a one-liner. I'd sure appreciate the company. I'll be too busy driving to try to type out a reply (aside from a possible F2-OK)! Please note that the SV-6 does NOT seem to support $GPRMC, so I'll be using $GPGGA (no course or speed data ... what a bummer!)

Also, does anybody in the DC/Silver Spring area know of an NTS net? What time/frequency/PL? NTS traffic handling is addictive, you know, and I'll need my fix! 73 & thanks to all.

>page can at least have someone to contact to help him get set
>up and on what and what not to do ...

GREAT idea, Bill! Count me in! As they say, "The More, The Merrier."

Here's another idea which I often implement (and I must admit I learned from Keith S.): When you see a new station on the screen (ie: one you KNOW is new to APRS,) Send 'em two one-liners welcoming them and offering help. What I usually do is:

"Hi de Arte & Welcome to APRS! Questions? ASK!"

"To reply press SN2ZRC <cr>, type msg & <cr>"

I'd say that 8 out of 10 take me up on it and STICK with APRS for more than just the few minutes or hours that those with no clue on how to operate the system do.

So, if you have the time and inclination, a little on-the-air elmering can go a long way. Next time you see an APRS newbie appear on the map, see if you can lend a hand. Remember when you first got started with APRS? How confusing, daunting and disappointing it was? Particularly with APRSDos, with all its nested menus and keystrokes? "If you elmer then, they will stay!" 8-{) 73

Rendered body type: text/plain

Bill writes, in various messages:

>maps...better resolution

>make maps "on the fly"

This capability exists - but not on the DOS/Win platform. If you were running a Macintosh in this application, you would have MacAPRS for the APRS side of things and MacDLG for producing highly detailed maps.

(MacAPRS is somewhat better than WinAPRS because the Windows version is simply a "port" of the Mac version, with some things lost in the translation. I run all three APRS's, and the Mac version is the one I keep going back to.)

In a serious professional/volunteer situation such as that associated with search and rescue, and public-agency funded mobile command posts, the computer platform is irrelevant - you should be making purchase decisions based on the solution, not someone's hardware prejudices.

>via cellphone

An interesting idea, but given the size of many of the 100K DLG files and the realistic throughput of even a "28.8" cellphone-compatible modem, I will hazard an edu-guess that you will not be able to reliably download USGS data this way. Cellphone connections are notoriously unstable, and the probability is very slim of your being able to sustain the 15-20 minute connection needed to download the bulky DLG files for even one half-quadrant. Again, this is an interesting idea, but the user-accessable technology hasn't caught-up yet.

There's also the assumption that you're going to have cellular coverage everywhere you go, or, in a disaster situation, have a fully intact system. Reality (and my direct experience) is otherwise. You're far better off using the CD-ROM; to heck with it being obsolete next year. Besides, one 100K CD-ROM will pay for itself quickly - unless that cell account is totally without cost.

22. New MacDLG Uploaded

From: Mike Musick <71301.3106@CompuServe.COM>
Date: 02 Sep 96 15:18:08 EDT
To: <aprssig@tapr.org>
Message-ID: <960902191808_71301.3106_FHJ73-1@CompuServe.COM>
Rendered body type: text/plain

Just uploaded into the APRS SIG "upload" area on the TAPR FTP server is a new revision of MacDLG, v1.04. It is a maintenance release fixing/adding:

- [Mac/Win] Correct internal notation of map type version ("1.00" instead of "McDL")
- [Mac] Major routes will display as 2-pixel lines
- [Mac] State routes with letter designators or route numbers > 300 will display as thick gray lines instead of brown.
- [Win] Lettered or high-numbered routes will display as dark gray (local arteries).

  - [DOS] If minor routes are not selected, lettered/high-numbered state
      routes will be gray lines.
  - Slight improvement in display speed.

File is MacDLGv1.04.sea.hqx.

If you have downloaded v1.0, due to the "internal notation" fix it is crucial
that you delete v1.0 and replace it with v1.04. Maps produced by MacDLG v1.0
will probably not work in future releases of Mac/WinAPRS.

For MacAPRS users, the difference in map coherence from the "thick lines"
feature is phenomenal. My hat's off to Keith Sproul for alerting me to this
hidden ability of MacAPRS.

Sample maps generated with v1.04 are also uploaded to the FTP site:

  Boston.sea.hqx
  MidMissouri.sea.hqx
  Peoria.sea.hqx

Enjoy!

  ...mike/N0QBF

26. APRS 7.7

From: Gary Wells <gwells@nbn.net>
Date: Mon, 02 Sep 1996 19:43:25 -0400
To: aprssig@tapr.org
Message-ID: <322B711D.75B0@nbn.net>
Rendered body type: text/plain

Sir: I am using APRS 7.7 and have 2 items that may be of intrest. First, I am using it with a Davis Weather Monitor II. Several times, when I have quit APRS, and then gone back, APRS can not find the weather station. It diaplays the Getting WX Station Data message, and locks up TIGHT. Rebooting does not help. The only way I have found to get APRS to find the WX station again is to reboot, start Weather Link software, access the WX station, quit Weather Link, and then start APRS. Maybe APRS doesn't release the WX station when it quits? Any way, I now know how to avoid the problem, just thought you would like to know.

Second: Ther is a box on the map screen that displays Tracking mem. I have not been able to find any reference to that in the Readme files. I think I have figured it out, so this is FYI only, no reply necessary.

This is a marvelous piece of software, keep up the good work.
Gary, N3HCP

27. Shelby, Pico, Trimble and lessons learned.

From: "Bruce W. Martin" <martinbw@telalink.net>
Date: Mon, 2 Sep 1996 19:22:30 -0500
To: aprssig@tapr.org
Message-ID: <9609021922.AA30350@oscar.telalink.net>
Rendered body type: text/plain

Just got back from the Shelby, NC hamfest. I figured that since there are a lot of digis along the way that this would be a great trip for me to use my laptop and dosAPRS (I usually use MacAPRS) along with my 2 port PicoPacket.

I recently retired my Icom IC-2A and VoCom powerpocket in favor of an Icom IC-25a. I spent the provious week making sure that the Antenna, Radio, TNC, & GPS worked well together. Unfortunately I failed to include the laptop in these tests since I had used the laptop and TNC together before and felt everything was ok there. WRONG!!

In the four days of the trip I found that I had an intermittent connection in the Antenna mount. I was able to buy a new mount on the first day in Shelby.

It took me until over two days of reading, experimenting, reading, experimenting cycle to find that I needed to change LGE from $00 to $05. BTW: Bob, might I suggest that since you give the option of TAPR, AEA or Pico to set what TNC is used that there should be coresponding INITTAPR.TNC, INITAEA.TNC and INITPICO.TNC files I would also think that three different restore files would be in order.

Finally on Saturday I had solved software and transceiver antenna issues when my garman GPS45 loses lock on the satelites. I tried resetting the GPS45 but still nothing. I was using the GPS45 with a Trimble antenna I purchased from PacComm. I left the Garmin antenna at home so i could not try that to see if it was an antenna problem (IT WAS).

Lessons learned:

Check everything and make sure it works perfectly before you leave home. Carry spares of as much as you can.

Bruce

Hi Don;

Actually, that is one of the more common uses, posting
threatening weather to APRS... (at least it is around
here)

As long as you make sure that your path is set to just
your local digi (by call sign, not by the common alias of
RELAY or WIDE) then your data packets shouldn't be a
problem for anyone.

By all means, play with it. After all, you are the local
expert and will be expected to be able to answer
questions on techniques, as well as solve problems.

regards,
Joe

> places an object at that site with the desicnation of <C-5> (An object).

APRSdos REPLY/COMMENT:  The actual packet ALWAYS contains the callsign of
the "transmmiiter"  if the <C-5> stations was lets say W3ABC-5, then the
actual on air packet would have been:

W3ABC-5>APRS,WIDE:OBJECT  :LAT/LOMG/etc...

WHere the word OBJECT would be displayed on the PARS map.  APRS only uses
the last three characters of a callsign as a hint as to who is actually
transmitting the OBJECT.  This is because using the full 9 characters
would use up all most all of the comment field on the P list...

APRSdos REPLY/COMMENT: Seems to me that that is exactly what APRS is
deisgned for. As soon as organized SKYWARN nets come up, they can set the
better local rules, but it seems you are fulfilling the true sense of ham
radio by posting your info voluntarily. Only caution would be to not
send such info beyond two WIDES tho. SInce you will typically see only
stations out 2 WIDES, you should not QRM stations beyond that range...

Don,

This is one of the kinds of things for which APRS was originally
intended!

Keep it up!

About the only time it may not be a good idea is if the item you're
tracking is not of general concern to your area and there is something
else going on of greater interest like a marathon or such, which is
being supported in some way by APRS. In which case the additional
channel load may not be appreciated.

Rendered body type: text/plain

```
Has anyone had problems with the Toshiba Satellite T1910 Laptop in HSP
mode? I have been pulling my hair out trying to figure out what I did
wrong on the HSP circuit (Come on! It's only TWO transistors!!! :-) ) when
I discovered that it was the laptop that was causing my problems. The
Toshiba would toggle the DTR low, but eventually it would not recover. The
DTR line stayed low. It would stay this way until I opened the data path
from the GPS RX (For info, I am using a KPC-3, a Garmin 45XL, and the
aforementioned Toshiba. I tried version 7.5C, and then version
7.6fDosAPRS). I hooked up another laptop, an older Dell and it works just
fine, with only an occational "I/O Gltich while toggling NEMA" message.
        I should mention that I am a total "Newbee" to APRS. I am hooked,
and we are using it on the local MS-150 bike tour next weekend (9/7-8). I
am trying to get all the bugs out of the system, and since the Toshiba is
a faster computer I would rather use it. Any suggestions?

Had a MOST enjoyable lunch with KB9LBU and WA9FFL in Rochelle, Illinois, Monday afternoon as I departed Chicago for Kansas City...It occured to me that meeting face-to-face is good for all of us....

Then, a bolt from the blue (actually a smack from Karla!) gave me an idea....

Wouldn't a NATIONAL APRS GATHERING be a NEAT event???? I'll even go so far as to say that the Kansas City APRS Working Group would be willing to host such an event. There is certainly an ample supply of hotel/motel space with meeting rooms here, not to mention a fairly mature APRS network operating.

We could set up over a three-day weekend, I'd suggest, and bring in Bob and the Sproul Brothers, surely we could get the usual support from the various APRS-affiliated suppliers like PacComm, Kantronics, Garmin (I can pretty well guarantee and BIG Garmin presence if we did it here) and others...

Anybody have any comments?

So what do you think? Kansas City, BBQ, APRS all at once? Only way it could get any better is if the beer was free!!!

Comments welcome!!!

41. Mouse problem

From: kf4dys@juno.com (Joe Foor)
Date: Tue, 3 Sep 1996 00:26:13 PST
To: aprssig@tapr.org
Message-ID: <19960903.005256.7663.0.kf4dys@juno.com>
Rendered body type: text/plain

```
Hi Bob;

I realize you probably are getting tired of hearing about the mouse
problem, but here are a couple of additional details, that I haven't
seen mentioned.

When the left mouse button quit working, this time, I examined the
symptoms and discovered that the left mouse button is still selecting
the zoom factor.

Normally, the steps to zoom the map are:
1) place the curser where you want the center of the display to be.
2) click the right mouse button (selecting the lat/lon for the new center
point)
```

3) the zoom factor window appears
4) place the curser on the desired zoom factor
5) click the left mouse button (selecting the zoom factor and initiating the map re-draw)
6) the map re-draws with the selected point at the center of the display and at the new scale

When the mouse left button "fails", this is the required procedure:
1) place the curser where you want the center of the display to be
2) click the right mouse button (selecting the lat/lon for the new center point)
3) the zoom factor window appears
4) place the curser on the desired zoom factor
5) click the left mouse button (selecting the zoom factor)
6) strike the space bar to initiate the map re-draw
7) the map re-draws with the selected point at the center of the display and at the new scale

If, in the second procedure, you omit step 5, the map re-draws at the original scale, with the new point in the center of the display.

Since the left mouse button is still working to select the zoom factor, apparently APRS is still recognizing the left button, just not performing all the required functions.

Also, when removing callsigns from the (H)eard, (L)ast and (P)osition lists, the left mouse button must still be used, even after it has supposedly "failed".

To remove a callsign from the (P)osition list, normally:
1) place the curser on the callsign to be removed
2) click the left mouse button (selecting the callsign, hooking the callsign and bringing up the hooked commands menu)
3) strike (D)elete on the keyboard (rewriting the list, with all the callsigns below the selected callsign moved up one line, overwriting the selected callsign)

To remove a callsign from the (P)osition list after the left mouse button has "failed":
1) place the curser on the callsign to be removed
2) click the left mouse button (selecting the callsign)
3) strike the <enter> key (hooking the callsign and bringing up the hooked commands menu)
4) strike (D)elete on the keyboard (rewriting the list, with all the callsigns below the selected callsign, moved up one line, overwriting the selected callsign)

If, in the second procedure, you omit step 2, the response is "NOTHING FOUND", just as if you had attempted to hook a location on a map, where there was no station.

Again, APRS is apparently recognizing that the left mouse button has been clicked, it is just not performing all the required functions.

regards,
Joe

>afternoon as I departed Chicago for Kansas City...It occured to me that meeting
>face-to-face is good for all of us....

Paul and I enjoyed the lunch with you and your wife. Glad we could use APRS to monitor your route and do an APRS co-ordination with you on the highway. Getting a chance to meet the faces behind the call signs both here on the SIG and on APRS is great.

>guarantee and BIG Garmin presence if we did it here) and others...
>
>Anybody have any comments?
>

It sounds interesting, but is there enough interest?
If not, co-ordinating with another major event would work as well. For
example, The ARRL convention at Peoria Superfest in Peoria, Il. I understand
Bob is a speaker there, Maybe the Sproul's will be there, as well as Joe Agrelo.
By combining functions, we might see more exposure, have more people
there, and make the trips more worthwhile. Sorta like a late summer Dayton.
This was just a thought... I like the idae though.

Rendered body type: text/plain

Hi All,

In preparation for my trip, I've collected the following
repeaters, grouped in order of the southbound leg. If you can,
could you please update this (ie: pl, machine's long dead, new
ones, etc.) Again, the projected route is via I-95 to the
beltway, or one of the parallel roads (US-130, US-1, US-40 etc)

Although this isn't strictly APRS-related, I beg the SIGs
indulgence, since I WILL have APRS with me running on the lap-
top. Thanks.

I have the same problem when running Win95...if I access my com3 port which has a shared interrupt with my com1 port...so the question is....

Gary...do you have more than two com ports and if so, are you sharing the same interrupt for one pair....ie: IRQ4 on com1 and com3?

I should note, however, that I can solve the problem by doing the windows warm startup...ctl-alt-del, ending the task, and then restarting the program, without having to do a cold start or running PC-Link.

PS: Bob, I presume you are fixing the fade to gray problem for dvs wx stations which showed up again....it seems to be generated in the time routine....when I boot up, I am in 2*HF mode...even when I switch to VHF only....the time stamp is keeping the z at the end...ie:

I boot up at 1600z in 2*HF mode, then I switch to VHF only, and the time stamp changes to 1200z...instead of just 1200.

We have a CD-ROM full of maps for use with MacAPRS and WinAPRS, over 500
meg of the 650 meg is Mac/WinAPRS format maps, this is our format whcih
allows unlimited size maps. there is about 75 meg of dosAPRS maps and
about 50 meg of misc docs and other stuff. The software is NOT on the
CD-ROM.

We sell this cd for $25.00 plus $5.00 s/h, send your check or money order to

Mark Sproul
698 Magnolia Rd
No Brunswick, NJ 08902

> Here's what I did:

[snip]

Ralp,
What you did seemed pretty COOL, but it was illegal and dangerous!!!
As you obviously know, you may not use any receiver on board a
commercial
airplane (Federal Aviation Regulations). The pilot cannot even permit you
to do it. A GPS is a receiver!! And you knew that!!
So what did you do when you were showboating for the other
passengers ??
You could have endangered your and everybody elses lives, since it
could
have affected the onboard navigation system. Depending on the type of
airplane you were in, some have OLD equipment. Be aware that in a
holding
pattern, the protected airspace around your aircraft is limited, and the
pilots are expected to remain within. If they bust this, and it creates a
conflict with another airplane, the pilots may have their license
suspended for 30-90 days. That's a big fine (loss of income) for your
showboating. Next time, if you are not sure, ask the pilot prior to using
a receiver. Don't ask the flight attendant.

73.. Knut
Airline Captain

PS. If this had happened on my flight, I would have had you arrested for
endangering everbody's lifes.

Seeing you occaisionally now.  If you use WIDE,WIDE for a digipath, it
should get you repeated here, and from one more that hears us.  WXSVR
has
been a pain this weekend.  Dale has almost no hair left.  Think we may
have a more stable version running now.
73,
Gary

We are now testing a path through W7LUS (thanks to KG5QD) for
distribution of hurricane data as taken direct, and automatically from
the NWS wire.  The should begin appearing within a couple of minutes of
receipt of the bulletin.  They will indicate current, reference (3 hr
old), and 12, 24, 36, 48 and 72 hr forecast positions as taken from the
NHC forecast advisory, and will include hurricane (red) and tropical
storm (yellow) wind fields through the 36 hour forecast (not given by
NHC in the 48/72).

You should also see, in the bulletin page, the first few lines of the
PUBLIC advisory, issued by NHC, within a few minutes of it's receipt.

These plots and bulletins are repeated about every 20-30 minutes, so
```

screens will be kept updated, without hogging the freq.

Reception reports, comments, questions etc. welcomed, either here (garnold@naples.net) or direct to Dale, the digital genius who has written this code (kg5qd@aol.com).

The 30m link from Naples outbound is located at KG5QD for the time being, and is available whenever possible. We hope to have a 30 m link at the EOC, colocated with our VHF port shortly. This will be at 160 feet, and would be a 24 hour port.

73,
Gary WB2WPA

```
There is an airshow scheduled for this weekend in Harrison AR. The local
radio club will be working providing "backup" communications. Also, I have
been talking with the the Conferderate Air Force (which by the way all the
pilots are Hams!) about putting in an APRS package aboard thier aircraft.
As it turns out they are not going to do much flying at the show, but,
would like to talk about possibly installing a mobile APRS package
permanently! As you can imagine, I'm jumping on that one! Anyhoo, don't be
surprised someday when you see a "squadron" on aircraft moving across the
screen!!!

```
Just a few questions! And please answer before noon tommorrow! (Sorry for
the short notice but we have a "eye to eye" tomm. with the NWS)
How do I get the NWS interested in using APRS as an alternative to a
failed SKYWARN (Voice)Net?
How do I get the HAMS involved?
Who has successfully installed and has a good working APRS SKYWARN NET?
Any suggestions, help, comments, gripes, complaints, ect. ect. will help!

Knut,
Are you sure of this. I believe that GPS is now certified for use in
aviation. In fact, I have been up in the cockpit with handheld recievers
going over it with the crew. I am not saying you are wrong, but I am
surprised. In fact, the precision approaches from 98 on will be mostly GPS.

All electronic equipment used in an airplane must meet TSO requirements
(certification requirements) for its use. GPS is widely used in
airplanes, but the individual model number must meet the above TSO.

Now for passengers carrying their own equipment onboard, the Federal
Aviation Regulation is clear:

FAR 91.21 Portable electronic devices.
(a) Except as provided in paragraph (b) of this section, no person may
operate, nor may any operator or pilot in command of an aircraft allow
the operation of, any portable electronic device on any of the following
U.S.-registered civil aircraft:
(1) Aircraft operated by a holder of an air carrier operating
certificate [AIRLINE] or an operating certificate; or
(2) Any other aircraft while it is operated under IFR. [All Jet
operations are conducted under IFR]
(b) Paragraph (a) of this section does not apply to -
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the operator of the
aircraft has determined will not cause interference with the navigation
or communication system of the aircraft on which it is to be used.
[A list of these devices is typically found in the in-flight magazine,
and typically include computers and cd-players. No airline will permit

```
AM/FM RECEIVERS, TVs, cell phones etc.]

The text in [  ] is added by me. As you see from this regulation, it is
not up to the pilot, but up to the airline (with the FAA's approval) to
determine if a particular electronic device may be used. To my knowledge,
no US airline allows ANY type of receiver provided by a passenger to be
used.

There is no doubt that you can go out and buy a IFR approved handheld
GPS. The problem, again, lies in who provided the equipment, the airline
or a passenger.

We have had a few cases where erratic indications have been observed
during approach, that stopped when the flight attendant asked a passenger
to turn off his 'walk-man'.

Hello Thank you to those stations between Warner Robins and FT. Myers
that contacted or Were active on APRS this weekend. I enjoyed APRS as
always. And even if there were some 'holes' in the network, I still
enjoyed watching myself going down the road. Several stations had very
nice updated <and current> Hurricane info. K4FUY on Sanibel IS, FL acted
as a relay, and was helpful in getting my packets to the Wide in Naples.

I travelled to FL in June and there were NO stations in the area of FT.
Myers that I saw, so that you again to those that were available.

I don't have a solution but will report on a similar problem that has since disappeared. APRS wouldn't start communicating with the TNC from it's WIN95 icon (DOS) until I went into hyperterminal and kick-started the TNC. This consisted of just the simple connection at 4800 baud. Once that took place I could exit and APRS would start without the TNC COMMUNICATION error.   This problem started when I installed 7.6F.

Maybe just a qwirk, but the problem has since disappeared.

Aha, there lies the rub. I've checked most airline magazines while onboard, and I've never run across a specified ban on GPS receivers. I've heard that Alaska Airlines (on this SIG) has them (GPS) listed.
The ban on cell phones is under regulation mainly by the FCC. This is to keep cell-phones from "lighting up"
several hundred cell sites at once! It applies to any cell-phone in any aircraft in the air.

Many consumer electronic products emit possibly harmful RF. I know for a fact, that my Casio PDA emits a strong signal on 123.10 AM which is the Air-to-Air frequency used by Phoenix Police when talking to News Helicopters. For that reason, I refrain from using it onboard aircraft. I've "sweep tested" my Magellan Trailblazer XL through the entire VHF avaition band (as well as others) and it emits no birdies. I also have an electric razor, a Norelco, which sets off my weather-alert radio (on 162.55 mHz FM) every time I use it! This is a compound problem as it takes several harmonics to do this. I've even read of hearing aids causing interference with radar detectors and cell phones.

This is the problem. The "ban" on receivers is short sited, because a CD walkman or a cheap laptop computer is just as likely to cause harmful interference as a GPS receiver, if not more so.

Message-ID: <199609040050.TAA24234@tbc1.tbcnet.com>
Rendered body type: text/plain

The use of GPS in the cockpit for instrument flight is restricted to a GPS with an updatable database and installed in the panel of the aircraft. A GPS approach is a Non Precision approach which, unlike an ILS approach, is a precision approach and provides altitude and runway centerline guidance (Category I [200 ft], Category II, [100 ft], and Category III [touchdown]) with special requirements for air crew and equipment for category II & III. An example of a non precision approach is a VOR approach which might not even align the aircraft to the runway centerline. Also, the minimum altitude is usually closer to that of an NDB approach (Non directional beacon). When differential transmitters are in place at each airport that has a GPS approach. This will then change things, but for here and now a GPS approach is a Non Precision approach and hasn't replaced the ILS approach. A handheld GPS doesn't have an updatable database and isn't installed in the panel, so can't be used for IFR flight.

```
Hello All,

First I would like to say I am delighted to be back on the SIG after a two
month absence during my move from NY to VT.

I was sad to leave the "heavily" populated APRS area around NYC, but I was
also surprised to actually see three stations on APRS here in the Champlain
Valley of VT/NY.

Which brings me to the point of this message:

I would like to purchase a GPS unit to take with me in the car and on the 50+
miles of bikepath around Burlington, VT.  It would be primarily to track
myself from the computer at home.  I have never looked into purchasing a unit
before.  Which one is for me?

I want a unit around $300, since I still need to fork out another $100-$125
for another KPC-3.  I assume I want one with an attached antenna, with a
connection for an external one.  I also (I think) need one with a NEMA port
in order to use it for APRS.  I have seen one with a nice map display (I
think it was a Garmin), but that is not a necessity.  Any suggestions?  And
what is the Garmin 45 everyone seems to have?

Thanks in Advance!

 AARRRRRRGGGGGHHHHH..... !!!!
  Someone is using Microsoft Explorer. Please fix this so it's not attached
to every message you send. I'm not sure of the source. I know we went thru
this some time ago. A knowledgeable individual please advise the source how
to "FIX" this. I forgot or I'd rely to them directly myself.

87. NWS INTEREST IN APRS

From: wa4ikq@nevets.oau.org (Geoffrey Dick)
Date: Tue, 3 Sep 96 21:33 EDT
To: aprssig@tapr.org
Message-ID: <m0uy6q3-000QkFC@nevets.oau.org>
Rendered body type: text/plain

> ===
>From wa4ikq Tue Sep 3 20:40:33 1996
To: aprs-fl@tapr.org
Subject: NWS INTEREST IN APRS

In reponse to questions posed by KC5JGV,

NWS in Melbourne became interested in APRS when they saw all the automatic
transponding weather stations ham radio operators were running 24 hours a
day. In the Orlando metropolitan area alone, 4 weather stations are on APRS.
It also helps to have a knowledgable APRS ham willing to install and train
NWS on the operation of APRS. A demo is worth a thousand words.

My impression was it is, but since most new users don't read all the
documentation till they have a problem (I'm guilty here), they don't know
about it till someone posts a BLN or they get told directly. It's an issue
in Chicago area too.
  Bob, Mark, and Keith,
    It's too bad the APRS software can't check the unproto path for this
condition and put up an error message( smirk..smirk.. hint.. hint). I know,
I have no idea what's involved, but you cant blame a guy for asking.

As I understand it "those rules" specifically state that if an electronic
device is not specifically allowed to be operated, then it is prohibitied.
I also understand that is is the "operator" of the aircraft, not the
steward / stewardess, or pilot that must give permission. (ie. the
airline company)

Dub-Yo-Zeree-

Are you positive it is the computer and not just APRS keeping it toggled low?
I found that when I was only outputting a certain sentence (GGA, I think)
from the GPS, that APRS would appear to
lock up while waiting for HSP data.  I think it actually displayrd a message
similar to "HSP port time out".

I changed the GPS to output RMC as well and APRS was happy again.  I
mentioned this to Bob when I visited him at the Naval Academy last November
and he was going to look into it, but I'm not sure what happened.

In rereading your message, I see that you are using the Garmin, which gives
all the sentences you need (unless the XL is different from the regular 45)-
but I am going to send the message anyway in case anyone else is having the
problem I had.

Again:  I worked around it myself, and Bob has probably already handled it
in the program.

Dont know what airline you fly for but DELTA allows VHF-FM
receivers to be used on board, inflight but not during
take off or landing. Refer to the back of the Delta Mag
on the flight. Dont have a copy with me now but do remember
a ban on TV's among some other items

Doug.

98. APRS MAPS on Internet with javaAPRS

From: "William B. Bliss/WB6LPG" <wbliss@coastside.net>
Date: Tue, 3 Sep 1996 21:50:14 -0700
To: aprssig@tapr.org
Message-ID: <199609040450.VAA16739@poseidon>
Rendered body type: text/plain

Hello to the Sig,
     ATTN: Steve/KO4HD, Bob/WB4APR, Rich/N2CZF, Bill/WA8INZ, Bob/N6FRI.

Need some help, enlightenment on how you are linking active APRS area Maps to Internet connections, and using javaAPRS.

We have a Sailboat race "BAJA HA HA", from San Diego down coast to Cabo San Lucas, Oct 28th. Yachting magazine sponsoring race and wants to set up a WEB page, with active APRS maps. We will be in QSO and GPS tracking KN6KB/Rick S/V Second Wind, during race, possibly others and want to input APRS map with S/V posits, to the Race WEB page.
Have no idea of how you fellas are linking the active APRS map into your Internet addresses to be observed real time.
Does it require a dedicated phone link to your Net provider, and active continually, or does one dial up your URL and your computer is linked to your MAP actively. JUST HOW DO YOU DO THIS. ???.
I have downloaded javaAPRS, but cannot figure out how to use it. I cannot copy your java net inputs/info, as am using old Netscape Ver1.5.2 and it says cannot read JAVA ..
Do I have to have Netscape V3.o, can new MS-Explorer with Win3.1 read JAVA files. ?????
What do I basically need to provide an APRS to a Web site for the Yachting world, for an active tracking down the Calif coast to Cabo San Lucas. ?????

How do you get the APRS MAPS, to appear on your WEB sites.???

Any help, ideas , thoughts , hint/kinks how to, would be greatly appreciated. Have read the javaAPRS instructions, but throughly confused as to how to use it. ??.
Again thanks for any replies, or advice. Other than simple straight forward DOS operation, do not understand a lot about computers, programing, files, and still and old DOS only, operator. No Windos 95, struggle with using Win3.1..
73's & Enjoy, Bill/WB6LPG ....also <bbliss@juno.com> for E-Mail only.
NNNN

WBB/WB6LPG

Yes, Dayton, INDEED!  I'm suggesting an APRS-ONLY event (of course it would
eventually become a MAJOR hamfest as more and more amateurs take up APRS!)...Am
I just going overboard with this (Bob, comment???).  All I can say is that by
year's end we should have I-29 and I-35 covered across Missouri, I-70 to the
east and something out west in Kansas.  It would be a real site to have a couple
hundred APRS mobiles careening wildly (usually the result of putting eyes on the
computer more often than on the road then realizing it!) toward Kansas City...

Still looking for more comments.  So far it's about 6:1 in strong favor....

>How do I get the NWS interested in using APRS as an alternative to a
>failed SKYWARN (Voice)Net?

Show them the software in an easy session.  Demonstrate the WX.BAK file and play
the track history for them.  Explain how a mobile station in the field can place
himself on the map and the APRS station at NWS will instantly see the exact
location of the spotter without having to rely on the driver to describe where
he/she is.  Demonstrate the one-liner messages and bulletins and PARTICULARLY
make a demonstration of the NWS symbology for WX objects (W - U  Weather, Use
NWS symbols commands)

>How do I get the HAMS involved?

Good LUCK!  Same way.  Go to every club meeting.  Give away software.  Do live
demonstrations.  Nothing sells new users like seeing the software actually plot
a packet on the map!!!

>Who has successfully installed and has a good working APRS SKYWARN NET?\

Moline, Ill (Quad Cities), Milwaukee, Des Moines in the Midwest....There's a
start....

We've been over this ground before, folks. Any type of radio receiver can cause
the navigational equipment malfunction or misinterpret data it receives due to
spurious emissions (birds). Best suggestion I can make is: Buy your own plane
and go from there. While the pilots response was a little terse, he IS right.

Better get permission from the pilot first. You're lucky somebody didn't
confiscate your equipment!

Hi Bob

I have made several maps of the UK and have distributed them to a couple of
guys in Cheshire and East Anglia. I believe that Cheshire Raynet is quite
active with APRS. Let me know if you find any more interest and if you want
a copy of the maps I have.

I both agree and disagree. First, there are several local APRS groups
already in operation, having local or regional meetings etc. are highly
encouraged.

On the disagree side, I concur with Bob Bruninga, "isn't it called Dayton".
As it is there is Dayton, the DCC, the Annual ARRL convention, Keith tries
to attend ALL of these and in fact IS attending ALL 3 this year, most years
he does make it to Dayton AND DCC (not the ARRL convention). If a
"National APRS" meeting was held, we would of course feel obligated to
attend and there are only so many weeks in a year.

Mark

108. Re: [APRSSIG:4373] APRS MAPS on Internet with javaAPRS

From: Steve Dimse <sdimse@bridge.net>
Date: Wed, 4 Sep 96 09:36:53 -0400
To: <aprssig@tapr.org>, <wbliss@coastside.net>
Message-ID: <199609041333.JAA21071@bridge.net>
Rendered body type: text/plain

>   Need some help, enlightenment on how you are linking active APRS area
>Maps to Internet connections, and using javaAPRS.
>
>   We have a Sailboat race "BAJA HA HA", from San Diego down coast to
>Cabo San Lucas, Oct 28th. Yachting magazine sponsoring race and wants to
>set up a WEB page, with active APRS maps. We will be in QSO and GPS tracking
>KN6KB/Rick S/V Second Wind, during race, possibly others and want to input
>APRS map with S/V posits, to the Race WEB page.

This is exactly the sort of thing javAPRS is great for.

>   Have no idea of how you fellas are linking the active APRS map into
>your Internet addresses to be observed real time.
>   Does it require a dedicated phone link to your Net provider, and active
>continually, or does one dial up your URL and your computer is linked to
>your MAP actively. JUST HOW DO YOU DO THIS. ???.

For now, the two locations that feature live data data have direct connection to the internet. Neither of these two methods is released to the public (One uses an OS/2 program to server the data live, the other uploads files with the latest data onto a web server). I am working on a system that will allow dial-up users to dump their reports to the network, but it is months away from release.

However, for what you want to do, there is an 'easy' way to do it, assuming there is someone on land who gets the position reports by whatever means. These can be entered manually into a file and placed on the web server for access.

The biggest problem with doing really cool stuff with Java is the security. The applet, and all the data, must come from a single internet address. You can't run the applet from your hard disk and get data from a web server somewhere else (at least if you are using a web browser like Navigator or Internet Explorer).

>   I have downloaded javaAPRS, but cannot figure out how to use it. I
>cannot copy your java net inputs/info, as am using old Netscape Ver1.5.2 and
>it says cannot read JAVA ..

In the latest versions of javAPRS, there is a file javAPRSprog.html which contains instructions on setting it up. There is no Java applet in this page, and it should be readable in any browser. You can view it online at:

http://www.bridge.net/~sdimse/javAPRSprog.html

>   Do I have to have Netscape V3.o, can new MS-Explorer with Win3.1 read
>JAVA files. ?????

I believe that the new IE can do Java, but I'm a Mac guy, so I don't know for sure. All platforms with Netscape Nav 3.0 support Java though.

>   What do I basically need to provide an APRS to a Web site for the
>Yachting world, for an active tracking down the Calif coast to Cabo San
>Lucas. ?????
>

1. You need a WWW server on the web. It does not need to know anything about Java, the server just sends the applet files as it would any other data. If you have someplace you can create a home page from your internet provider, that is good enough.

2. You need javaprs.zip from the TAPR server. Upload the javAPRS directory to the directory on your web server where the html file will be. You can strip out any of the data files you don't need (.hst, .nmea, and .tnc), and any maps in the /maps directory you don't want.

3. You need one or more APRS maps that cover the area you want to display. Put these in the maps directory that is within the javAPRS directory. Be sure to change the suffix to .mp, as .map has a special meaning to some Web servers.

4. Write your html file. See the instructions in javAPRSprog.html, and look at the example html files. Feel free to lift anything in them you want to, especially the command summary in soeast.html. Be sure you set the parameters to use your map and data files. Be sure you add a link to my page and email me with the address of your site, per the licensing requirements (see javAPRSprog.html).

5. Get your data onto the server. Use a filename ending with .tnc, for example race.tnc. The data is simply what would come out of a TNC. Look at the trip.tnc file in the javAPRS.zip package for examples. The data formats must be followed exactly. Put the datafile within the javAPRS folder. As posit reports come in, someone needs to add them to the file, and upload the changes to the server.

>   Any help, ideas , thoughts , hint/kinks how to, would be greatly
>appreciated. Have read the javaAPRS instructions, but throughly confused
>as to how to use it. ??.

Nothing good is ever easy! ;-)

>   Again thanks for any replies, or advice. Other than simple straight
>forward DOS operation, do not understand a lot about computers, programing,

I have posted this message to the sig because I thought others might like to see the answers. If you have further questions about javAPRS, please send them to me directly so as not to waste the sigs bandwidth.

Bill, look for me later this month, after I drive to Seattle for the Digital Communication Conference I'll be heading south on PCH to visit friends and family in SoCal. Maybe I'll stop by and give you a hands on lesson in javAPRS!

> Most everyone is using an Unproto path with at LEAST
>>three WIDE's....I thought that was a NO-NO.

How many wides are used is determined by local net density and topography. Here in central Iowa the standard is 3 wides. If we didn't do this, our net would be about five stations, instead of nearly 30. We coordinate our activity with the guys in northern MO and all is working well. We have received zero complaints.

There is no hard and fast rule. It depends on the situation and the coordination/cooperation of those people in the coverage area.

Hamstringing the software to enforce some arbitrary standard that does not apply to unique environments is a TERRIBLE idea.

John and the Group;
To relieve yourself of the weight of a KPC-3, you may want to read the info
Bob has included with APRS about Mic-Encoders (found in
C:\aprs\readme\vox-aprs.txt). If the family want's to reach you via voice
AND wants to know just where you are, this idea would save you the extra
load of a TNC and another radio.

Bob goes into some pretty fancy ideas, which sound neat. You could do it
with much less complexity. But for just a station or two on a simplex
frequency, you'd only need the full TNC at the house along with the
"standard" radio/computer equipment.

While on the bicycle a Mic-Encoder built into a speaker microphone, a
radio, and a GPS receiver would do just dandy for portable use. This is
for installations where you won't/can't have a laptop to watch yourself,
ie., on the bike!

Although, thinking about it... If you drive your car to a bike trail, then
ride the bike, you could do the Mic-Encoder on the Bike, and a standard
APRS setup in the car AND make it a RELAY to the house!

Good luck on the type of GPS receiver. Cheers, Bill Neal

Hi all

I tend to agree with Bob and Mark. A Higher Profile at Dayton will have far greater effect. A specialized national meeting is
most likely attended by those already interested. A forum at Dayton on the other hand is likely to be attended by many that
are just curious. Some of these people will get involved and broaden the base of APRS operators. To satisfy the power or
advanced users a meeting like was held a couple of years ago at Dayton in the communitee room of that apartment complex is
the way to go. With all the time constrants of many of us I believe that the results would be better if we maximize the
current situations first.

Also another way is to make APRS better known is buy attacking the regional hamfests in the exact same manner. Also If you
feel confident ask your local club if you can make a meeting presentation. Most clubs would fall over dead if someone asked
them. They're begging for people to do meetings.

Just some of my thoughts. Forgive the long windedness(sp!).

Good Point! However, APRS is rapidly becoming the #1 choice for new hams
in packet. Think about it. Young hams, new hams, are raised looking at
computers, graphics, and such. If you think your going to get those (kids)
interested in ham packet without the (bells and whistles) graphics (dos or
winders) your only fooling yourself. For us that have been in the
transition phase of all this, we get excited over a new symbol or function
that is added.
Computerists (a term I like to use to include all people especially the
younger ones that use computers daily) are much more "glassy eyed" when it
comes to packet (APRS) then us hams, and understandably so! They want
"gotta have it" stuff that no one else has (yet) and they want it now! We
on the other hand have learned (I hope) that these things take time to
develop and need to!

OOPS got off the subject didn't I? (Too much time on MY hands!) I'd like
to see a "mid-america" APRS gathering started and repeated each year. For
the simple reason that the more we get the word out the more users and
ideas we are bound to harvest!

(Sorry 'bout the spelling, I'z waz edumekated in Arkysaw!)

From: Hank Holt <ks4ny@pen.net>
Subject: APRS and Emergency Comms

We have recently been working with a local hospital to help them install a
working Amateur station complete with APRS and to train their own people to
become licensed hams.  During a newspaper interview, a reporter asked us if
any other hospitals had installed APRS to enhance their emergency
communication.  Does anyone have any information for me on this?

Please respond to me at my E-mail address since I am not subscribed here.

Thanks

Hank

So Sorry Jim, but it's NOT EASY HUH!. Because the person is not at that site.
And i have checked there's nothing other then the <C-5>. But whi cares anyway.
I was asking abt the legality because i think he wrote the software himself to
do this. Easy huh, Jim.

20 to 30 miles apart, that's realy close (And to close to be using 3 wide's, come on now. Play the games by the rules or don't play at all. Not trying to flame you but 3 wides is asking for problems. Get a better antenna that's what it sounds like you need. I get stations 160 miles away, Just before getting on here i was keyboarding with a user in Atlanta and the digi i was using was 102 miles away and i was not using 3 wides.

In APRSSIG digest 681, Mark Sproul wrote re the National APRS Conference:

> I both agree and disagree. First, there are several local APRS groups
> already in operation, having local or regional meetings etc. are highly
> encouraged.

True, and being Secretary of one of the largest APRS users groups around (NIAN, 70+ members), I couldn't agree more that local meetings are important, but National meetings get users together to work on the "Big picture" and to learn new ways to do things that you may never discover locally. Right now we are working on several things here in Chicago where National face-to-face input would be great.

> On the disagree side, I concur with Bob Bruninga, "isn't it called Dayton".
> As it is there is Dayton, the DCC, the Annual ARRL convention, Keith tries
> to attend ALL of these and in fact IS attending ALL 3 this year, most years
> he does make it to Dayton AND DCC (not the ARRL convention). If a
> "National APRS" meeting was held, we would of course feel obligated to
> attend and there are only so many weeks in a year.

Ok, let's go over those events you mentioned.

Dayton, we have one or two seminars that brush over the basics of APRS in the hope of selling its' use to the attendee, nothing in-depth, no problem solving or future planning. The Saturday evening eyeball is one way to get into the "big picture" stuff, but it's way too short, and people are tired from festing all day and have a lot of things to do in a very small time.

DCC, I haven't been there, but while it may be a digital (ie. packet) conference, it's not devoted to APRS, not attended by a lot of day-to-day APRS users, and does not get into the in-depth things that a lot of people are interested in. APRS is just one of many items on the table for that weekend.

ARRL National Convention, the same things as Dayton and DCC apply.

Furthermore, I would think that the authors would see a lot more APRS users who could help shape the future of APRS at one weekend devoted to APRS than they would at Dayton, DCC, & ARRL combined.

I hope the Convention comes to pass, and have conveyed my feelings on this to Jim Duncan as well as offering my assistance to make it happen. I hope to see all of you there, whenever it is.

Maybe we can get someone to donate Coke since I doubt anyone will donate the beer.

128. WIDE,WIDE,WIDE, GATE, and ERROR MESSAGES

From: henryvb <henryvb@dpliv.com>
Date: Wed, 04 Sep 1996 21:15:20 -0500
To: aprssig@tapr.org
Message-ID: <322E37B8.3566@dpliv.com>
Rendered body type: text/plain

In APRSSIG digest 681 it twas written regarding WIDE,WIDE,WIDE:

> Bob, Mark, and Keith,
> It's too bad the APRS software can't check the unproto path for this condition and put up an error message(smirk..smirk.. hint.. hint).

This is not an error. It may not be the best operating procedure, but it's not an error. The last thing we need is another stupid message like the one for a vhf station running GATE.

First, regarding the WIDE,WIDE,WIDE. There are times when a station could be in the middle of a string of WIDE's and using that path to propagate two or more directions MAY be correct, just like there are times when using RELAY or WIDE is really acceptable for the 1st digi in the path for a Base station, or RELAY is acceptable for the last station in a digi path, or etc., etc., etc.

I spent several hours a few weeks ago in a mobile where the only way to get the traffic to me was by using a RELAY on the end of the incoming path, because I could only hear one of two base stations at a time, but they both could hear the WIDE, and could not hear each other. If the last digi had been a particular station, then I would have been cut off from the world at certain times. We can't make concrete rules because they always need to be broken.

Second, regarding the message that VHF users should not use GATE in their path. There are times that a VHF user SHOULD use GATE, like when I am 500 miles from home and use WIDE,GATE,GATE,Call in my path 5% of the time to get a position report or a message back home. I'm certainly not choking the net anymore than the inane stuff that I am treated to every day by HF stations that do not know (or do not care to learn) how to set their path properly (reference the routine message traffic between two HF stations using a path of GATE, WIDE, WIDE!)

The point is: We don't need another message in the program telling us what is right or wrong. VHF users have been using GATE in their paths for months and ignoring the message, like the VHF bozo in the Chicago area using RELAY, WIDE, GATE, WIDE, WIDE (an impossible path by the way.) This guy refuses to change his path, so we just budlist him.

Users should learn how to set their path correctly, and more important, how paths REALLY operate. This is the responsibility of the local user group to educate new users in proper paths, since the documentation is sorely lacking on this topic (one of the things that should be a seminar topic at the National APRS Convention!)

In addition, the DosAPRS message about VHF users on the GATE should be removed because 1: it is ignored, 2: it is not accurate, 3: it and the program logic to compute and display it wastes precious memory space.

Don't bother sending me mail or posting to the SIG on this topic unless you have an excellent understanding of digipath operations. I have been working on them for almost two years and understand more than most users do on the subject.

Bob, I have seen that you have gotten all sorts of input on this already. The new version seems fine for some applications. From what I have needed for info for RACES work it would be nice if one of these schemes could give TEMP/RAIN/RAIN TOTAL/BARO. With this coupled with TIME/WIND/WINDGUST/RAIN it is easier to get a good over view of the situation. This helps in looking at flash flood potential, seeing temp inversions (BIG PLUS in mountainous areas durring LARGE snows), looking at wx that could affect HAZMAT incidents. Please keep in mind that the WX guys aren't the only ones that could be looking at this data. The FEWER screens you have to TOGGLE thru to see the data THE BETTER.

Secondly, is there a fix to the fading WX ICON on the screen of wx stations, and is this linked with the Wind direction indicator only showing up when there is a wind speed? My position list does have the time of the last beacon, however the home station is not showing up in the home station heard list.

Yes, but here in the flatlands, where the digis are 100-200 feet high, 30 miles is just about right. Not everyone can put digis on mountains, and space on the few really big towers costs really big bucks! The name of the game here is communication, and you have to do what works. Sure, I'd love to live in a place where the digis were 2000 feet up and 100 miles apart. But if we put one digi every hundred miles in South Florida we'd never see each other. Also, you seem to forget that APRS is about tracking things, not keyboarding. Sure, high power and a big beam antenna will work further than a mobile, but it's not what I want in APRS. You really ought to be more tolerant of other people's needs.

Thanks.

What version of APRS are you using? DOS or WinAPRS? What operating system?
Amny other apps running at the same time?
  That looks like a message Windows 95 would give out during a crash.

I woulld assume Keith, Mark, and Bob would need more of the above info to be
able to find something. You may want to address the details to them directly.

Well my answer to this is that here in the South Eastern states i can
honestly state that i rarely if ever see anyone using 3 wides. If it works
here why won't it work elsewhere. I aggree that 3 wides shouldn't even be
in the software.
>
> Second, regarding the message that VHF users should not use GATE in
> their path.

I fully aggree with removing that nag window, all a person needs to do
anyway is to use the HF even tough he's TX'ing on VHF and the window will
be gone.

>

And how many users realy attend these seminars.
>
> In addition, the DosAPRS message about VHF users on the GATE should be

I fully aggree with this, why waste the memory and space required for this.

> Don't bother sending me mail or posting to the SIG on this topic unless

> do on the subject.

Well Henry, your almost saying that nobody else knows how to run APRS
besides yourself. I have been using it longer then that and i'm still
learning i admit, but have NEVER used 3 wides (Never needed to). So calm
down don't get all upset (Remember the majority rules Hi).

>day-to-day APRS users, and does not get into the in-depth things that a
>lot of people are interested in. APRS is just one of many items on the
>table for that weekend.
>

Last year, and again this year there is a whole afternoon worksop on APRS
given by Keith. I thoughly enjoyed the one last year, and am looking
forward to it this year. This was where many APRSers first saw MacAPRS,
and the decision to port MacAPRS to windows occured because of what
happened at this meeting. The talk by Phil Karn got me fired up to
contribute somehow to ham radio, the end result of that is javAPRS. This
year three of the papers being presented are about APRS. Don't
underestimate the importance of this conference, especially to the
"people that shape the future of APRS" (if only Bob would come....).

The question I have is what do you hope to accomplish? For getting real
work done: answering questions, formulating future plans, and developing
standards it is hard to beat a long, deliberate process via email. Face
to face meetings are good for brainstorming and furthering interpersonal
relationships. The three meetings mentioned are all good places to meet
others that share our interests, shake hands with email buddies, and
drink beer. There will never be a place where _everyone_ who likes APRS
can get together, and if there were, it would probably produce more
fist-fights than progress! ;-)

So, for those of you who think a national APRS convention is important,
exactly what agenda would you propose? Tell me what you think needs to be
done, and how you propose to accomplish it in a couple of days. Propose a
schedule of events...if it's worthwhile, I'll come, and so will a lot of
others.

I should be more tolerant, you realy mean not to voice my opinion right. If all
i could do is sit here in front of my computer and watch vehicles moving around
and couldn't keyboard as you are suggesting i would wipe APRS off of my system
instantly. To each his own, but Steve you should be more tolerant about a person
doing some keyboarding since that's one of the features many of the users in
this area prefer to do. Sorry if my message upset you but it wasn't meant to.
But i will continue to voice my opinion as the posting warrants. Not everyone
will aggree. But hopefully this is a Free Speach Sig.

```
Today 9/05 I will be putting Plots for Fran on 30 M via WX,W7LUS,GATE,WIDE
generated at the Collier County Florida EOC directly from the Weather wire.
Objects are sent from wb2wpa-4 via WX,WIDE,WIDE,MARCO on 2 meters and I use
the "MARCO" as a key to strip the callsign and path and put my call and path
on the packets and send on HF.    The FRAN _REF object is the refernce
time/posit to which all the forecasts are relative.  The objects keep the
same names from update to update so a screen refresh will clear the old and
plot the new.  Intermediate Advisories change the main hurricane plot
 only(ie the one with a vector) and dont always show wind fields
73 de kg5qd Dale Marco Island Fl

Oh come on, Bill, wake up.  Texas is like Florida, flat as a
pancake...our wides are 30 to 40 miles apart also and they still can't
hear half the time....you guys in the hills have a real advantage with
VHF radio signals....I saw stations at that distance when I was mobile
up in GA/TN...but not here...no way.

Gotta agree with you Henry...100%...for example...my station is at
center of a three pronged system....wide to the north, four wides to the
```

east (to FL east coast), and two wides to the south....It is impossible
to list digis by callsign and send posits to all of the above, however,
an unproto path of KF4FOH-10, wide,wide sends the posits in all three
directions with the first call being my local wide. There is no other
way to do it and as a weather station sending info to all those other
users as part of the SKYWARN network....it is a necessity.--

I pretty much agree, and having been down there in Steve's/Rich's/Kevin's country - I can attest to this. Florida is doing a lot better with coverage in just the last 6 months. New digis in Ocala and possibly Daytona will help extend the edges even more.

Now if we could just get the folks in Macon GA and South to put up digis (and in Macon's case: a real digi) we can begin to see I-75 coverage for 3-4 states down here. It would also be great to see the Savannah folks in the "rest" of the net.

Here where we can have digis at 2000-5000 ft MSL, we are truly lucky- but here in the South, we're the exception- not the rule! We just happen to be situated at the lowest end of the Appalachians and Blue Ridge Mountains.

Let's hope that WIDE-N (or whatever it ends up being called) gets implemented in TNC-2 Code and Kantronics Code so that the intelligent digis can help stifle the dupes. When this happens, you can run WIDES until you get tired of typing and the DIGIS will resolve the foldbacks.

I know PacComm is working on it, but is any other Manufacturer listening???
Not all digis are TNC-2/Clones.

```
I have a couple of questions regarding digipaths in the Chicago area.  BTW,
the No IL area was, up until a couple of years ago, defined by a Channel 2
newsperson as "Chicago" or the "boonies."  He said it, I didn't.

At 22:04 9/4/96 -0500, you wrote:
>First, regarding the WIDE,WIDE,WIDE.  There are times when a station
>could be in the middle of a string of WIDE's and using that path to

>the path for a Base station, or RELAY is acceptable for the last station
>in a digi path, or etc., etc., etc.
>

If my station beacons at 5 watts, with an unproto of WIDE, I'll easily hit
CJN Wide/Relay, which will then rexmit my station to whereever CJN reaches,
which, according to its Mheard list, is N9RER Wide in Chicago and W0BXR-8 in
Muscadine IA.

Isn't it true that if I change my unproto path to WIDE,WIDE I'll hit CJN AND
RER AND BXR-8 AND CJN (plus WMM-15)?  And I'd hate to think what kind of
mess would result if the pwr was kicked up to 50W.

And if it's changed again to WIDE,WIDE,WIDE, won't I hit CJN,RER,WMM,BXR,
CJN,RER,WMM,BXR, etc (i.e., multi-collisions) in the local area, in addition
to to whatever wides THOSE wides can reach?

I think I'm starting to see the wisdom of a 9.6k/UHF backbone link.

>I spent several hours a few weeks ago in a mobile where the only way to
>get the traffic to me was by using a RELAY on the end of the incoming
>path, because I could only hear one of two base stations at a time, but

>last digi had been a particular station, then I would have been cut off
>from the world at certain times.  We can't make concrete rules because
>they always need to be broken.

Won't a path of WIDE,RELAY cause all kinds of havoc in the Chicago area?

>The point is: We don't need another message in the program telling us
>what is right or wrong.  VHF users have been using GATE in their paths
>for months and ignoring the message, like the VHF bozo in the Chicago
>area using RELAY, WIDE, GATE, WIDE, WIDE (an impossible path by the
>way.)  This guy refuses to change his path, so we just budlist him.

>Henry
>N9WMM
>henryvb@dpliv.com

And as to the bozo/GATE question, I believe the "DEFAULT" path (not the one
that automaticly comes up, but what you get when you hit the "DEFAULT"
button) for the VHF port on WinAPRS is GATE,GATE,WIDE.

So, as FIRESIGN THEATRE once said, "We're ALL just bozos on this bus."

Some one asked for an agenda?

I'd like to see a siminar on Paths (WIDE WIDE WIDE?) On Digi Setups
(KPC-3's) On Remote WX staions/digis. Which brings me to the question
again, has anyone set up a remote combination digi/WX station? Hopefully
using a KPC-3 and the U2000?

The subjects on siminars are simple, take each and every command and talk
about it for and hour or two! Then, when we all wake up we'll be a bit
smarter! hihi

As Fran makes landfall this evening, take a close look at FEMA Office of
Emergency Information & Public Affairs situation breifs. Especially the
Red Cross and the US&R (Urban Search and Rescue Task Forces) reports. You
will more than likely see references to Ham Radio Operators support.
When this is all over with, I suggest we try to get detailed reports on
the operations success and/or shortfalls. With this information we, as a
group, should look at areas where APRS could have been used and whether or
not we should propose it's use in the future. This could be a group
discussion at the ARPS convention, if we have one that is.
At any rate, it looks as though this storm could be a catagory 5 by this
evening and there will be a lot to talk about and discuss. I only hope
that those folks "down yonder" have taken all precautions and no one is
injured or killed.

Exactly! When surounded by digis, use the closest (most reliable) one as
the first hop in your path! I am adding yet another digi to the area.
There will now be three within 40 miles of each other. I can hear and hit
all three from the QTH but will in no way use WIDE WIDE WIDE. This doesn't
make sence! We are trying to build a reliable SKYWARN net here before the
late-October  November Tornado season starts. And in doing so must lay
down a heavy hand in these matters of path usage and proper setups. I
understand fully how the path can be misunderstood or misused by new users
but not after some time unless to station is just doing it in spite of
everyone else. This falls under the "police your own" net by the Net
Coordinator.
Again this would be another great subject for a siminar at the ARPS
convention. I'm sure it would be an interesting one!

```

I don't think that's true, either, Ralph. IIRC, Garmin's non-
aviation handhelds, both marine (45) and otherwise (38/40,)
do indeed shut down at approx. 99 knots; their non-handhelds,
like the TrackPacs and the GPS20 and GPS25 OEM boards,
do not. Am I somehow missing information on a Garmin
unit?

If you have different information, I'd like to hear it.

BTW, if anybody out there has built some interesting
device with a GPS20, you won't believe how much better
the GPS25 board is! Wow!

Hi Kevin, that's realy funny ;-). Actually it's just the other way around, i am
in the Tennessee valley surrounded by Big hills and mountains. The way i make
sure i can hit the digi is by antenna system. I can easely hit the digi in
Birmingham 102 miles away (having to go accross several mountains). Don't tell me
on flat land you cannot hit a digi at 30 to 40 miles away, my answer would be
install a better antenna system. I aggree things are different for those folks in
flat land areas, but not to have to use 3 wides. Some have stated (Including Bob
i believe) not to use beams on APRS, well i do and it has and is working great
for me and this is what you may have to do to reach a good digi. I mean Kevin it
takes about $10 to make one that will do it. I am against (And always will be)
using 3 wides, just my opinion folks.

To: aprssig@tapr.org
Subject: [APRSSIG:4414] Re: National APRS Conference

I would vote for having a national APRS meeting in late October down in Steve's Haven of Key West. As part of proficiency training we could track the most exceptional body painted individuals.(thats a hint as to why I choose Key West in October)

As for all the discussion on unproto path's; anyone have any thoughts on an algorithm that could be used in a program to simulate the results of different unproto paths using an HST or BK file to provide the direct, indirect, and hop information of an existing path?

I'm once again trying this reply in MS Exchange with the mime selection turned off. I'm curious if that fixes the exchange attachment problem.

I'd also like to thank all the people that responded to my inquiry about a Solar Panel charge controller. I found a place that carries QST and read the article. I have 2 Micro M's on the way. Once I finish the Solar Powered remote Wide-Relay with U2000 WX I'll upload a file with JPEG's and a write-up on the whole thing.

At 12:35 AM 9/5/96 -0500, you wrote:
>>Of course you would have it in Kansas, but i think it should be in an area
>of >most APRS activity, not because that's where you sre located ;-)
>>
>>No flame just joking Hi.
Kansas City makes alot of sense. For those of you who have to fly
commercial (grin) airfares in and out of KC are CHEAP. The are reasonable
rate hotels a free shuttle ride away. There's alot of open space, clean air
and BBQ!, but it's a long way from KCI airport (30 miles to KC Masterpiece
Resturant). There is also an active APRS community willing to work to set
it up.

The problem with Dayton is it is too little with too much else going on. I
could spend hours learning how to:
1. Make street level maps
2. Design APRS networks (Now was that WIDE or RELAY..humm)
3. Learning to NWS acros the country are using APRS
4. Having people volunteer to present papers of varies uses of APRS
5. Put your subject here.......

APRS has grown to the point that it probably has more users than Oscars at a
cheaper entry level, yet amsat has annual meetings for paper presentations
as well as going to Dayton. Don't get me wrong--I LOVE Dayton and the
chance to get away but, I could learn so much more in a APRS only environment.

Dave Kaplan
WB0WNX-7 Mojave AirMobile

P.S. Even if it is not in KC, I would probably go!

I've seen a couple of stations that don't transmit that
way...

I don't know if that's because they set up the TNC with
an alias in as MYCALL, or they used an alias when
entering the station data during the APRS setup
procedure.

I'm having a problem with my PicoPacket (2 serial port /DCD model)
defaulting on the RAM settings when the power is turned off.  The jumper is
in place and the lithium battery voltage is O.K.  Has anyone else had this
problem?  Since the default is LOC =0, setting it up as a "standalone"
beacon with my GPS-20 is a bit of a pain.

> KF4FOH-10,WIDE,WIDE sends the posits in all 3 directions with the first
> call being my local wide.  There is no other way to do it..

APRSdos REPLY/COMMENT: Yes there is, and it is better:  If you used
WIDE,WIDE,DIGI3,DIGI4, that would hit all 6 digis and you would avoid the
multiple duplication of the 3 W,W,W path you are now using.  Yes the
DIGI-10,W,W is the same thing as a 3 WIDE hop since all WIDES after the
first can still be re-duplicated by the first digi.. Also your path would
need DIGI-10,W,W,W to hit the 4th wide to the east, and this is in effect
the same as W,W,W,W !

I thought I would stay out of it this time, but the above message dared me
to come up with a "better way to do it".  Oh, in this case, the DIGI3 and
DIGI4 are the 3rd and 4th digis to the east.

The only complexity to the above scenario is whether the originating
station can only hit "one" wide the first time.  If he hits two or more
wides direct with his initial packet, then the path could possibley be
shortened even more! (it appears that this is the case, since he was only
using 3 hops, yet intending to go 4 hops to the east.)

There is nothing "absolutely" wrong with any chosen path, but it takes an
"understanding" to use them appropriately and creatively.

> way use WIDE WIDE WIDE. This doesn't make sence!

APRSdos REPLY/COMMENT:  WRONG as a general rule.  If you are surrounded by
3 WIDES, and can hit all three, then VIA a single WIDE will hit all three
at once!

Defining the first one by CALL is just wasting a hop and only mildly
solves the multiple duplication problem if you are going further.

There are *no* absolute rules.  Every path must be tailored to *each*
stations situation only.  But if you can hit more than one WIDE direct,
then it is frequently a good idea to start with WIDE to get your packet
initially launched in two or more directions at once.  Then once you get
beyond two WIDES, then you need to specialize the path.

If you need to go 3 or more hops in two directions then just specialize
the path in one direction, say, W,W,A,B,C and use the OPS-DIGI-ALT command
to set an alternate path of W,W,X,Y,Z and set it to be used 50% of the
time.  If you want to go DX in 3 or more ways, then you will have to wait
for PacComm to come out with the WIDE-N digi...

(was "Re: Too much time on my hands....")

Gee, y'all... demands on time surrounding the Dayton Hamvention are severe
enough already. I've not yet gone where I wasn't forced to bypass a forum or a
meeting or miss areas of the boneyard or cut short a long-anticipated
face-to-face QSO because there just aren't enough hours to do it all. So I say
not only "no" on Dayton, but "heck, no!".

And I concur with the observations about the digital conference - too much
unrelated technical stuff and not enough "general" draw for anybody but the
most hardcore APRS'ers. To me, that's like holding it at a VHF Conference; yes,
it's related, but barely.

Jim's KC offer is fine by me, but then, that's but a day trip away. So is
Peoria, where I know I'll see several of you.

I take issue with the statement that Hurricane Fran could be a CAT 5 by
tonite...
It is a strong CAT 3 now at 115 MPH.  Cat 5 is winds higher than 155 MPH.
Please don't make statements that can't be backed up by fact.  The
official
advisories are only saying that Fran could strengthen.  It continues to
increase
its forward speed and the central pressure is rising...both of which are
contra/indicative of strengthening.

167. Digi Path's

From: William Nolle <wa8inz@cris.com>
Date: Thu, 05 Sep 1996 11:24:40 -0700
To: aprssig@tapr.org
Message-ID: <322F1AE8.5176@cris.com>
Rendered body type: text/plain

It looks to me like ALL the messages i have seen in the past few days regarding digi path's have been from Skywarn people!. This is a great service and should by all means be helped to grow. But my question is if this is so vital as a public service then why bother beeing on 145.790 in the first place?. I hope all the Skywarn folks don't expect all the users on 145.790 to get off and let it be used for that purpose only. 145.790 is not a very good place for this type of service and in my opinion should be on a dedicated frequency by itself. I maybe all wrong (To most i always am) but this seams to be the solution to all of the questions about using 3 wides in the first place. It maybe a good idea to go 9600 on 70cm or whatever. Fellows just stating my thinking, like it or not.

I can remember not to long ago when we (Locally) where using APRS from the Red Cross for some local realy heavy weather conditions that killed several people and all i seen was HF gate'rs using the Bulletin function in APRS to chat back and forth. Just an example why the Skywarn service should be located on another frequency.

Go ahead and flame because i just got my fireproof suit overhauled thank you!. Like i say i believe in free speech on the SIG.

170. How about a Virtual Conference?

To: <aprssig@tapr.org>
Message-ID: <199609051706.NAA24674@bridge.net>
Rendered body type: text/plain

>I'd like to see a siminar on Paths (WIDE WIDE WIDE?) On Digi Setups
>(KPC-3's) On Remote WX staions/digis. Which brings me to the question
>again, has anyone set up a remote combination digi/WX station? Hopefully
>using a KPC-3 and the U2000?
>

Yea, there are four up now in the Florida Keys, plus mine when I'm not there (when I'm there I leave a computer on running MacAPRS). Email me if you have questions.

>The subjects on siminars are simple, take each and every command and talk
>about it for and hour or two! Then, when we all wake up we'll be a bit
>smarter! hihi
>

OK, so why not have people, instead of preparing and giving a talk, write it up? Do it as an html file (I'll volunteer to turn anyone's text file into html if they can't). Then we collect all these files, link them together, put them up on the TAPR server and other places. Sounds like that would be whole lot more useful than a one shot conference...it would be a virtual conference that keeps on giving....Sort of a FAQ on steroids.

We'd need a coordinator to collect the files, link and FTP them. I'd think about doing it if no one else wants to (but I'd rather not...I'd much rather work on javAPRS). If the group does decide to do this, we'll need some rules to slow the inevitable degeneration into flame-wars... These would need to be agreed upon prior to starting.

Ground rules I'd propose:

(These are just suggestions...there needs to be a lot of discussion about this.) The rules hopefully can be agreed upon after discussion by consensus but if there reains significant disagreement, a vote can be held. (See below)

The virtual conference coordinator position is by calendar year, decided by vote if more than one candidate wants the job. Voting open to any ham (valid license required, no non-ham relatives!) registered on the aprs sig when the vote is held, say first week in December). Votes would be emailed with callsign to some trusted 3rd party, maybe TAPR, for verification. First year would be for what is left of 96 and all of 97.

The structure of the overall site and the graphic layout, would be the sole responsibility of the coordinator. The coordinator could make cosmetic changes in submissions to preserve a common the look and feel.

The coordinator would maintain a listing (preferable available on the internet) of who is working on a given topic, to prevent unneeded duplication of effort. However, no one "owns" a topic, and no one is to be discouraged from writing about something that interests them.

If the coordinator wanted to contribute subject matter, it would be on the same basis as everyone else, no priority!

All submissions are identified by name and callsign in a stardard manner designed by the coordinator, and can, at the author's choice, be a single URL link (for example an http: link to the authors home page or a mailto: link to their email address). The date of submission would also be clearly displayed.

When more than one person contributes on a single subject, all contributions will used (i.e. no censorship). The way the contributions would be combined would be up to the coordinator, but any priority would be based on time of submission. For example, if two people submitted multi-page writeups on a command, the coordinator might elect to creat a page in the conference that briefly summarized the two submission and had links to them. A page talking about unproto paths with dozens of relatively short contributions might have all comments on a long single page, in order they were recieved, with a table of contents at the top.

When an author changes his material on a certain subject, he loses his

```
priority over others, and only a single submission per person on a given
topic. This is designed to prevent people from turning in something
really fast and ugly just to have the first slot.

No one may modify or reuse the material submitted by another without
their permission, however if you submit material you agree to it's
distribution as part of the whole, on internet, CD ROM, or any other
means, in perpetuity. (You can't take your marbles and go home!)

Material can only be removed at the request of the author, or after a set
time period (say 1 year), if it has not been updated by the author, and
the coordinator feels it is out of date. The author should be notified of
this in advance and given a chance to update it if desired.

I think it would be really great to see the sig do something useful like
this. Comments???

Sorry to disappoint all, but the Key West City Council banned body
painting this year. Next year, when the businessmen complain about the
lost revenue, it will be legal again. We've been through this cycle
before (body painting has been banned for 3 of the last 10 years, and is
always overturned the next year.) Politics.

For those of you who aren't following this, see:

I would also like to add (perhaps Support would be the more appropriate
term) to the flurry of Subject matters to be discussed at a Gathering. I
agree with the suggestion of making maps. There are many maps available,
but it would be nice to make my own. Also a wider knowledge base would
allow those with the time to be able to contribute. Just my $0.02 worth.

I have done a little of this already for WinAPRS, and will continue to do
so. I of course will not get directly involved with dosAPRS but would
volunteer to be the web cordinator and maintain the web pages.  Keith and I
have already put ALL of the dosAPRS docs in HTML form, they are on our
CD-ROM.  And as most of you know, the ONLY docs on WinAPRS are in HTML.

Though out the WinAPRS docs, I have taken peoples questions, coments, etc
to heart when doing the documentation, one person, (Arthur Martin, N2QAE)
did a real nice write up of the Win32S instalation, I made it into HTML,
made it look like the rest of the docs, put his name and gave him credit,
and included in the general WinAPRS docs.  I would very much like to
continue this as per Steves comments and do invite submissions now for more
info on Mac/WinAPRS.  I will maintian the dosAPRS stuff as well if asked.

Mark

APRSdos REPLY/COMMENT: THis is a good point, and since we are working on a new solar powered stand-alone WX-MIM which is a complete remote WX station, TNC, radio, antenna, and solar power system all rolled into one, it is time to consider getting a coordinated UHF freq in each area for these remote WX sites. WX is a local phenomenon and FIXED locations, so different freqs in each kingdom is just fine... Go get your UHF freq while you can!

Message-ID: <960905170309.204200f9@exame2.dseg.ti.com>
Rendered body type: text/plain

A couple of weeks ago I asked for any information or experience that was available about mounting laptop computers in a car. Thanks to those who responded with their information and experience. I've kept looking around for more options, since I still didn't have a clear idea of how to do what I needed to do. Today I ran across a company whose entire business is specialized mounts for computers, radios, cellular phones, and various electronic equipment in vehicles! As yet I can't vouch for this company, but am posting the information about it here so that others can tap this information if they wish to.

Gamber-Johnson
801 Francis Street
Stevens Point, WI 54481
1-800-456-6868

http://www.coredcs.com/~gamberj/ Web page

gamberj@chaos.coredcs.com e-mail

I called their 800 number this afternoon, spoke with a very pleasant young lady, and they are mailing me a copy of their catalog. It even turns out that they have a basic mount specifically designed for a Chevy Caprice, which is the car I need to put the equipment in!

There is an awful lot of what you need out there, somewhere - the problem is FINDING it! Enjoy.

I am using the following:

12 volt battery
12 volt to 5 volt converter to Garmin 20
Garmin 20 + antenna
MFJ 1270C
Alinco DR-130 transciever, 145.790

I have been unable get the MFJ 1270C to transmit data to the Alinco DR-130.
Am I missing a command?
I sure would appreciate any help so I my get going mobile.

73, GERVIE

Thanks Steve, a good reply.  APRS was written, I believe, with the mobile
user in mind where the mobile station may not know the call signs or
paths.  Multiple wides is the only recourse.
73,

John W. Wilson, KN4HX

I can explain it!  In order not to have to re-do the entire CONFIG file,
and since I never finished the AMTOR implementation, I re-defined that
single variable to be the indicator for the "type of WX display"
variable. (or some such new variable I needed recently)

 So if you are going back and forth betwen 77 and earlier versions, the
older versins may intermret the config file as AMTOR mode!

L3 APRS part 3/4

DIGIS.TXT 7.4c AUTOMATIC PACKET REPORTING SYSTEM DIGIPEATERS
(APRS .txt file continued::

********** WIDE-N ALL DIRECTION GENERIC DIGIPEATING! ****************
THE ULTIMATE SOLUTION FOR MOBILE POSITION REPORTING

This may be the simplest mechanism for making an order of magnitude improvement in APRS status and position reporting networks. In a WIDE-N network, each WIDE digi simply repeats ANY packet with the VIA address of WIDE-N; but ONLY ONCE. If it keeps a copy of the last 30 seconds of packets, (or at least a copy of the FCS) and compares each new packet that it hears with the LAST one that it digipeated, then it could decide NOT TO TRANSMIT it again! This would completely eliminate the multiple round-robin multiplication of packets generated when a mobile station uses the present generic path of WIDE,WIDE,WIDE. As it is now, such a 3 tier path launched in the middle of 3 WIDE digipeaters that all hear each other can generate as many as 3x3x3 or 27 duplicates in the area. If each WIDE-N only digipeated the packet once, then there would only be 3 local copies generated, and the packet would still propagate outward 3 levels in all directions in the usual manner! Since this algorithm has uses on ALL amateur packet networks needing a FLOODing mechanism for special packets of interest to everyone, I am calling it the FLOOD-N algorithm. For APRS, however, I will still refer to it as the WIDE-N algorithm.

NUMBER OF HOPS: Using the via path of WIDE-N, each DIGI that repeats the packet decrements the WIDE-SSID by one. This way, each packet carries along with it information on how many times it has bounced through the network. The user specifies how far it goes, by the initial setting of the SSID! If he sets it to WIDE-7, then the packet could be digipeated as many as seven times outward. A local commuter might select WIDE-2 to cover his area while limiting DX QRM.

NEW TNC COMMANDS REQUIRED: To make this work, there are three new TNC commands needed:

MYFlood: This command, similar to MYAlias, sets up the callsign at the digipeater to be used as the FLOOD-N callsign. In APRS networks, we will use WIDE. THIS IS FOR UI FRAMES ONLY! That plus the AGELimit below, makes it un-useable for connected frames, and for abuse.

HOPLimit: This is a SYSOP parameter that can be used to limit the maximum number of HOPS permitted in a network. Already the maximum number of hops is limited to 7, since the upper bit of the SSID is reserved for future use. However, on NON-APRS networks, some SYSOPS may feel empowered to limit the maximum number of hops to some smaller number.

AGELimit: The WIDE-N digi has to keep a copy of all digipeated packets for a brief period for comparison with new packets heard. This is the key to the WIDE-N algorithm. Every digi that hears a UI packet will digipeat it, BUT ONLY ONCE. To do this, it compares each new packet with all packets digipeated in the last X seconds. This X age-limit needs to be a variable depending on the speed of the network. If the time is too long, then the list is big, If it is too short, then there is the chance that a packet may propogate in a circle and get repeated again. My guess is that 30 seconds is a good default value for 1200 baud channels. Howie Goldstein, N2WX has improved the effeciency of this idea, by only saving and comparing the CHECKSUM of the packets, instead of the whole packet.

If ALL APRS WIDE area digipeaters changed over to the WIDE-N code, we would HAVE THE ULTIMATE GENERIC MOBILE GPS NETWORK! Metropolitan area commuters could set their digi paths to WIDE-2 and Mobiles on extended trips within a 200 mile radius of home could be tracked with a path of WIDE-5, without fear of clogging the network! This WIDE-N algorithm is so powerful that it could even be added to ALL TNC's as a FLOOD-N mode. It would only work on UI frames and would default to the generic callsign of FLOOD. That way, on ANY packet frequency, a UI frame launched into the air, could be seen by EVERYONE!

-----TexNet comment: I will have to think about this one carefully, first to make sure I understand it 100.00% and also to determine if I can successfully implement all of it without storing and comparing lots of buffers, which is otherwise deterimental to the functioning of the node. Also, I am unsure how the FCS compare would work for us if the packet is modified from one repeat to the next. I don't see how it could. The first two parameters are no problem.

Or if this is a digipeat-only issue, it may be irrelevant to nodes, except that it may be necessary also for the node to act as WIDE-N digi locally. I am still thinking about that issue, Maybe Bob B. can help here.

The file refers to ssid-s 7 and below, implying that 8-15 are reserved by something somewhere. Unless this is an APRS limit, I don't know what it is referring to. I've been using all 16 SSID's for a dozen years now, as far as I know they work as advertised.

LEVEL FOUR and TheNET CONSIDERATIONS:

----TexNet comment: what this text file calls level four in the arena of Thenet and its compatibles is generally considered layer three in the TexNet implementation. Other than the syntax, they are performing roughly equivalent functions, and there are variations in the methods and commands. TexNet does have imbedded applications, such as the disk based servers, the debugger, etc, and although not documented as such internally, they are layer 7 entities. Mostly this is all syntax gobbledygook for the critical reader.-------

Since NODES are so much smarter than digipeating, the ultimate solution is to have the NODES do all UI frame routing. The APRS station simply sends his UI frame TO APRS VIA HOME; Any NODE hearing that transmission that has knowledge of the route to HOME, will send the single packet via the NODE network (internode, level 4) to the HOME node! When it arrives at the HOME node, it is transmitted once as a UI frame. With this arrangement, a mobile only has to specify his one intended destination, no matter where he travels!

------TexNet comment: This is the basic method I would like to implement, but as explained earlier I don't have a real friendly way to specify "HOME" in a way that it will relate to some

destination network node without making it cryptic to the user.

The G8BPQ TheNET code for the DataEngine includes a DIGIon command that can restrict Digipeating to UI frames only. This is very useful, in that it allows SYSOPS to leave DIGI ON without inviting LEVEL-3 connects to use it which is detrimental to normal level-4 operation. The problem, however, is that the generic APRS RELAY and WIDE aliases cannot be used on a NODE, since the digipeat ALIAS is the same as the NODE alias, and you cannot operate more than one NODE with the same ALIAS on the same frequency or even in the same network! I got a call yesterday, 22 Nov 95 that G8BPQ has now agreed to add two more UI digipeater aliases that are not tied to any of the node functions.

-----TexNet comment: It MIGHT be possible in our situation to either specify just the first 1-6 characters and hope the 7th is non-ambiguous, or to actually use some fixed name, like "HOME", literally as a default, and it would be directed in the network as defined as a default in the node eprom. Comments? ----------------

DIGI/NODE COMPATIBILITY: Since the user should not have to change his digi path as he drives from one area to another, he should be able to specify a path that is compatible with both nodes and digipeaters. This is easily accomplished by assuming that the LAST field in an UNPROTO digi list is the HOME NODE and should be the ultimate destination for the UI frame through any level 4 network. Any and all preceeding fields are assumed to be DIGI's only. With this arrangement, the user could use an UNPROTO path of APRS VIA WIDE, HOME so that any generic WIDE digipeaters would repeat his position to their local area as would any WIDE NODES in the usual digi fashion. Only the node that hears the direct packet would also forward it through the network at level 4 to the HOME NODE. If only one field is included in the digipeater string, it would be interpreted as both a digi and a HOME destination without any difficulty. Digi's and NODEs would digipeat it, and nodes (hearing it direct) would forward it at level-4. It is important that NODES hearing digipeated UI frames from other digis do NOT enter the packet into the network, to eliminate duplication. Only the ones hearing the direct signal should be repsonsible for doing the level 4 routing..

------TexNet comment: The idea of mobiles transmitting the same address string as they drive from node to node is probably just fine. The idea of sending the direct path only downline on the network assumes that the network node site will unconditionally be able to hear mobiles, and they won't need a relay. Possibly I could intrepret this to mean the direct, OR the repeated copy, but then I have to keep track of duplications, and I sure don't want to put dupes onto a loaded network, memory safety valve or not. Comments??---------------------

EXAMPLE: A typical mobile just wanting to keep his spouse informed of his whereabouts might want to just use the UNPROTO path of APRS VIA HOME. Then his UI frames will be digipeated by the local HOME node or digi and will also be routed back to HOME by all NET-NODES along his travels. If he also wants to be seen by most HAMS in the areas of his travels, then he sets his path to APRS VIA WIDE,HOME. If he travels through a region that has both DIGIs and NODES, he might choose APRS VIA WIDE,WIDE,HOME. This way any areas with digis would digipeat via WIDE,WIDE and if he gets to an area with nodes which are aware of the path to HOME, then they will forward his packet there.

Finally, since most regional area Tracking networks are dedicated to APRS, the node should also permit the SYSOP to turn off other level 4 routing. Without this feature, such a network could be swamped if all of the BBS and other CONNECTED protocol users began to use it, and the original purpose of the network would be defeated.

------TexNet comment: TexNet has a provision for a sysop-controlled network-wide alert mode. When enabled, new connects are greeted with an extra message on the screen that the network is handling emergency traffic at node: xxxxxxx and to disconnect if you aren't participating, also the behavior of the network idle-user-timeout is inverted, and the PMS will deliver automatically to an addressee if he is on the server. Other things could be tied to it if necessary. My logic is based on the assumption that TexNet APRS support would exist on an existing network common with other applications, but ought to be configureable to accomodate the priorities of a parallel and dedicated APRS network. Comments?---------------

Still, most of these APRS support ideas could be included in all NODES so that a minimum of APRS tracking could be supported by ALL networks on all frequencies, especially where there is not yet a dedicated APRS TRACKING NETWORK. I think there are other undeveloped applications for shipping UI frames through ALL networks which have not yet been explored. The capability should be there, in any case, so that experimentation can proceed. Time will tell. These few paragraphs were primarily written to the NODE CODE writers such as John G8BPQ and Mr. Roberts of X1-J. But are included here in general distribution for all to read.

L3 APRS part 4/4

Now for some of my general questions and comments-
First, I need to know what the APRS I-field length limits are.

Second, I need to discuss routing. I presume it would recognize that a UI addressed to APRS needed to be processed. It would possibly have some addressing that needs to be acted on. It possibly would have been received without all of the "repeat" bits filled in, and under the APRS digipeating schemes, these may need to be processed. Then that brings up the question of duplications and whether or not to repeat them and how to filter them if so. I detest the idea of holding on to copies of packets already processed. The internal structure of the whole program is that it analyzes one packet at a time, and completes all actions connected with that packet, and then disposes of it and works on the next one in the receive queue. Any packets already worked on that generated transmissions are already locked away in a transmit queue for a radio port, and essentially unretriveable. Perhaps I could hold onto the FCS's of recent packets, as discussion in the above text file comments referred to, but then I would have to acquire the FCS, and presently I am pitching it, not buffering it up for analysis. I would be very tempted to only use one byte of it, not both, and that probably ought to be useable for the purpose of the last 5 or 10 packets or so. But I am still in doubt that the FCS is sufficient, because changing the repeated-bits in the addresses will change the FCS, so the whole idea may be useless. (One possibility is to COMPUTE, under control of the CPU, an independent checksum of just the I-field, instead of juggling the FCS from the SIO/SCC which of course sees the whole packet including addresses. That one only would use CPU computing time resources, not gobs of memory, and might be able to compare possibly a dozen previous packets, and would be lots more palatable, IF it didn't burn too much CPU time). Otherwise that means we might have to make a decision to repeat on some condition of completion of a certain part of the repeat process. That might be on the FIRST or the LAST, or some intermediate, or the Next-to-last, or something. Probably would have to be optional for each node, not just hardcoded. Suggestions??

Next issue is the form of the destination specification. It could be a default for each node. If addressed to NWS instead of APRS, it might assume a different default known to that node to be the node used by the particular NWS office, and general APRS might go elsewhere on a separate default. To make it work at the destination, the rebroadcast of a NWS report could still be to APRS. Also, since TexNet can specify up to 4 radio ports per node, one might want to specify some port info, maybe as a destination "SSID" like APRS-1 for port 1 for instance. It would probably NOT change the SSID of the destination since it would be regenerated

from a parameter string at the destination node, so it would be sent just to APRS.
(In most TexNet nodes, port 1 is the usual 2M user radio port).

Suppose one wants to direct APRS to some particular node, which is the general case of interest anyway. This sort of implies that a digi field be used to specify a destination node. That address would presumeably be the one FOLLOWING whatever address triggered the source node to process the packet as input. An address field is any 6 characters and an SSID, but a TexNet nodename happens to be any 7 unique characters, alphanumeric uppercase, so already we have a problem. There is another method, but it is not real user friendly. TexNet node NAMES are translated into 8-bit integers or nodenumbers, which are unique assignments within the network, and are usually seen in the routing tables to users as 3 digit decimal numbers. For instance, AUSTIN is 009, LUBBOCK is 014, and so forth. The idea I have is some field like T02014 and it is pretty cryptic, and runs something like this: the first 02 means network #02 (the network number within the whole planet Earth assigned to Texas-Okla-Ark-Mo is net #2, the GL-NET in Ind-Mich is #05, etc), and then the nodenumber 014 means Lubbock. I guess that port number info could be specified as an SSID, (sort of conflicts an earlier comment above) so to specify port 1 at Lubbock, one could specify T02014-1. Is that cryptic and unfriendly enough? Try to remember all of that while driving down the road pecking away on the laptop. Any better ideas? To make this a little more complex, I need to apply this same or similar trigger method to the modification I need to specify a TCP-IP connect, and that problem has to be worked on at the same time and be compatible. I have to completely specify THOSE connects in the first connect command to the network by the user, That process doesn't get a chance to use a command prompt. So it gets a little complex, and I am open to some suggestions. (Back in the days when we had codespace, our philosophy was to make the network easy to use and make the node CPU do all the nasty work for the user, which made the programmer have to figure it all out in advance).

There may be cases it may be desired to "broadcast" to more than one destination node. TexNet does have an inherent internal broadcast mechanism, and it also being used for external broadcast of severe-weather alerts and EOC-type warnings, but those things generate LOTS of trunk packets that fan out in all directions, and may duplicate if the network contains loops. We use them only for internal routing controls and for emergency alerting to the amateur community. When these broadcasts occur, sometimes the network is partially paralyzed for a few seconds. Unless they are triggered by NWS severe WX files, they are under SYSOP permission only. Comments??

There are internal partition capabilities to limit the geographical distribution of these alert broadcasts, for instance we don't send weather alerts across the Tex-Okla border (even when our problematic red-river trunk is operating).

I presume that under some if not all circumstances, it might be desireable to locally repeat the inbound APRS packet as any other WIDE or WIDE-N digi might do, in addition to forwarding it downline. This could be a configureable option. (discussed above also) Comments?

A little bit of info on parameters and options. TexNet is primarily an EPROM parameter system, but some parameters are adjustable remotely, either with commands like a remote route change, or by stuffing bytes into RAM with the remote debugger. We issue a standard image for EPROMS, which an administrator patches to make a particular image for a particular node, and the callsign, nodename, nodenumber, digi parameters, and the L2 parameters (T1, T2, T3, N2, TXD, DW, etc) get burned into the particular EPROM. Some of them like the L2 parameters, load into RAM on a reset and are changeable if one carefully uses the remote debugger, and we do so from time to time to trim performance problems. The route tables are built dynamically to match the network

as it exists at any given time (they are added/modified, but not deleted or timed-out) and also changeable by command, which sometimes take the form of master route files that are uploaded. The general intent is that the network should come up by itself and init itself in a useful manner, and that remote adjustments are limited to performance enhancing tweaks.

TexNet is inherently a network that is designed to a given area and given set of sites, and is of course expandable, and we in our area are still expanding territory. It is NOT given to daily expanding and contracting with propagation, although we have a few trunks that are propagation dependant. The route tables don't follow propagation by shrinking up as nodes become unreachable. The design assumes that they are available all the time. If the network is broken, you of course get a trunk-down error message from the node at which the break has occured.
(If you are CONNECTED. The UI would have NO mechanism to return errors).
More of the parameters are in Eprom, and less are in Ram, and all those that are in RAM are initialized from Eprom. There is no RAM configuration needing to be maintained, but it is patchable with remote commands or memory changes, which are not preserved through resets at the present time. This has been an ongoing debate.
Possibly in a few later revisions, after the effectiveness of some RAM data-preservation routines are field proven, we might opt for some of these parameters. The present RAM data-preservation routine has been observed to have corrupted a few times, and would need improvement. This may be undertaken again with the availability of the new TAPR TNC-xx (name is under discussion now) which includes a nonvolatile writeable memory device.

APRS support will generate more parameters needing to be set.
What should they be, and which should be EPROM and which should be RAM based, and how set, or any made dynamic?
Comments?

Since TexNet is based on 9600b trunks, I will also field questions on that subject, and TexNet inplements modems in somewhat different formats (usually incompatible) than others that are available, for instance the G3RUH. With the exception of the notorious trunk across the Red River, these trunks give good performance year round 24 hours per day, over paths of 30 to 60 miles long.
If one wants to use existing modems of different design, they of course can be connected to the hardware and will function, however it will NOT work to mix different types of modems on the AIR.
For instance the Paccomm SPRINT/SPIRIT has modem jumper settings compatible with the TexNet modem format.

As I previously noted, I am working without a whole lot of available code-space on some (not all) of the available platforms. I would like to come to some consensus for a simple eficcient method that will address most of the immediate concerns, at least on the first cut. Some of the bells and whistles will have to wait or not happen at all. But it is hard to predict in advance which will be hard and which will be easy, so I wanted to throw all of it on the table and look at it. (I would rather avoid storing packets for comparison of duplicates, THAT one does use lots of resources).
I will apologize in advance for the bandwidth this file uses, and I don't think it will happen too often (Please reply in small chunks, one issue or two at a time).

Part 4/4 END.

L3 APRS part 2/4

Next, I am going to insert selected paragraphs of an APRS distribution text file on Digi's and reply to it as I would to the e-mails.

Please comment here too.

DIGIS.TXT 7.4c AUTOMATIC PACKET REPORTING SYSTEM DIGIPEATERS

To satisfy the objective of a distributed network without dependence on specific nodes, APRS stations are designed to begin operating without any prior knowledge of the network. This is done by having all APRS digipeaters and home stations initialized to act as a digipeater with the alias of RELAY and to send all UI frames via the UNPROTO path of RELAY. With this form of generic digipeating (RELAY), a mobile, or new station does not have to know anything about the network in advance in order to be seen by adjacent nodes. After 10 minutes and his map begins to show the location of all stations and digipeaters on frequency, he can then customize his outgoing Unproto path to specific digipeaters to cover his intended area without as much QRM.

-------TexNet comment: The node is eprom based, and the calls, aliases and most parameters will be determined (at network node design time) and fixed in the eprom. They should be well planned, and it is assumed that the node will be in an advantageous fixed location.-------

CAUTION:------snip------

It is important in any mature APRS network that FIXED stations should avoid using the generic RELAY addressing. Although mobiles should usually begin their path with RELAY,WIDE, the path of RELAY should rarely be used after the first hop, and never after a WIDE.------snip-------

Although digipeating is not good practice for AX.25 level 2 connections, it is ideal for APRS operation using UI frames only. All along the east coast we have more than a dozen WIDE area DIGI's on the frequency of 145.79 acting as a backbone for mobile position reporting. The low duty cycle of this mode, also permits Keyboard QSO's and other UI frame applications. Even Personal mail boxes are welcome on the frequency, since mail is posted at keyboard rates and is NOT read back by radio. Users are NOT welcome to READ PBBS mail on the frequency. Other CONNECTED mode operation of BBS's, mail forwarding, file transfers, TCP-IP and DX clusters are discouraged.

----For TexNet, it should be feasible to define a radio port to not permit connected mode operations by application, meaning no network access, no conf bridges, no PMS, etc. My only question at this point is if/how we would permit a weather spotter to initiatite and maintain a connected mode QSO with an EOC or NWS net. Or is this a consideration? And maybe another idea MIGHT be to create a regional network-level NWS kbd conference bridge, and permit access only to it and no other connects on the APRS port. Also I need to research my code to see if the existing mechanism operates on both source and destination ends of a connect.----------------------------------

APRS DIGIPEATERS: In addition to all the home station RELAYS, additional APRS RELAY digipeaters can be installed where ever needed to provide solid mobile coverage on all major access routes into your city. These sites provide the first hop (via RELAY) for all mobiles. Next, a few well elevated and WIDEly separated digipeaters should be installed which have not only the RELAY alias, but also a WIDE alias. These WIDE sites link to other cities and provide a backbone for wide area coverage.

WIDE DIGIPEATING: Since these WIDE area digipeaters are located at excellent locations, they should not only provide the WIDE backbone function for the long-haul, but should also have the RELAY alias as well for nearby mobiles and new stations. Many recent TNCs can be set up to digipeat either of these generic RELAY/WIDE packets. The new PacComm TNC's can support up to 4 aliases!. Set MYAlias to WIDE and set one of the other TNC functional callsigns to RELAY (such as MYnode, or MYhost, etc). If you use the KPC-3 and the MYnode call, be sure to set USERS to 1 and NUMNODES to 1. If your TNC does not have dual aliases, AND yours is the only WIDE around, you can temporarily make its MYcall be WIDE and its MYalias be RELAY, but be sure to put the FCC callsign in the BText to keep it legal. You can also have one other DIGI with the opposite MYcall RELAY and MYalias WIDE without confusion. These WIDE/ RELAY backbone Digi's should be spaced several tens of miles apart depending on topology so that they are as widely separated while still being able to hit their adjacent other WIDE digi's. All mobiles then can set their UNPROTO path to APRS VIA RELAY,WIDE and it will not matter whether they are near a DIGI or someone's home station to be picked up by the network.

------TexNet comment: The callsign structure of the code lends itself to addition of additional digi addresses, and at code-compile time it would be feasible to provide 2 or more digi aliases to be programemd for whatever the administrator wanted to burn into them. That one I think is almost a no-brainer in the code. I can imagine that there are a few spare control bits that could be used to flag some new-to-be-written code hooks to also cause these packets to be transferred over the network, as well as repeated on freq. also to control whether connected mode or just UI's are to be repeated. ---

Even if these WIDE/RELAY backbone nodes are 30 to 50 miles apart, as long as every home station and local RELAY digipeater can hit at least one WIDE, then the mobile path of RELAY,WIDE can cover as far as 100 miles! Wider ranging mobiles can use the RELAY,WIDE,WIDE path without causing too much QRM. Yes, RELAY,WIDE,WIDE should NEVER be used by a home station, but since a mobile can rarely, if ever, hit more than 1 digi the first time, the number of repeats is not much worse than a typical home station via WIDE,WIDE.

CAUTION:---------snipped lots------------

DEDICATED WIDE AREA APRS DIGIPEATER SET UP

To set up a WIDE area APRS digi, simply connect a TNC to a radio, and put it as high as you can get it. Set the following minimum commands:

```
cmd:   MY W3XYZ-x                 (the digipeater call and SSID)
       MYA WIDE                   (this makes it digipeat WIDE packets)
       MYN RELAY                  (This works on KPC-3s as a second alias
       MYG RELAY                  (on PK-12)
       UNPROTO APRS VIA WIDE,WIDE,DIGI3...     (so the whole net sees it)
       B E 60                     (Sets Beacon to once every 10 minutes)

       BT !DDMM.mmN/DDDMM.mmW#PHG5360/WIDE-RELAY...(identifying comments)
            |         |      | | ||||  |___|_ makes station show up green
            |         |      | | ||||________ Omni (Direction of max gain)
            |         |      | | |||_________ Ant gain in dB
            |         |      | | ||__________ Height = log2(HAAT/10)
           LAT      LONG     | | |___________ Power = SQR(P)
                             | |_____________ Power-Height-Gain PHG indicator
                             |_______________ # is symbol for digipeater
```

As you can see by the integers in the POWER-HEIGHT-GAIN (PHG) string, there are only 9 plus 0 possible values for each of these fields as follows:
----snip-----

----TexNet comment: Probably all feasible, and a secondary periodic beacon string will have to be defined to resemble the example. I presume it can go into eprom, since we are assuming a fixed node site?? Now for a dumb question on my part: if we had some live data acq (wx sta, etc) on node-site, would that data go into this frame also? Or a different frame? ----------------------------

HEIGHT ABOVE AVERAGE TERRAIN: -----n/a----
NOTE ABOUT POWER LEVELS: -----n/a----

X1J DIGIPEATERS: You may set up an X1J node to act as a generic WIDE area APRS digi, depending on whether the ALIAS callsigns are not already in use. The X1J permits 5 callsigns. The first two are the NODE callsign and the NODE alias. These pertain to level-4 NODE operation and can NEVER be made WIDE or you will LOCK-UP the network. The next three ALIASES are for a BBS, DXCLUSTER or HOST mode operation. By enabling two of these extra aliases to WIDE and RELAY, then the node will digipeat APRS UI frames as long as the following commands are also performed:

```
   PARM / 23 1   Digipeat enable  (info provided by WA4HEI 906 341-5718)
   MODE / 14 1   Extra alias monitoring enable
   MODE / 17 3   Refuse digipeated L2 node uplinks & downlinks
```

------TexNet comment: As above, I think it practicable to provide extra digi aliases, and I think that I could specify their behavior.---

OPERATIONS WITH RELAY AND WIDE:

Although the GENERIC WIDE/RELAY digipeating works well to get an APRS net going, once you have more than two WIDES, the generic calls should be avoided by all fixed stations to minimize unnecessary duplicates and collisions. Using SPECIFIC callsigns significantly reduces QRM.

While building a new network, APRS has a special SETUP-WIDE command that permits some well situated stations to change their default RELAY alias to WIDE. This command should be used with caution and with the agreement of all stations on the net. Too many WIDE's, too close together causes too much QRM. When you use the SETUP-WIDE command, the word WIDE will be installed in your POSIT comment field. This signals all stations to display your station symbol as GREEN (which indicates a WIDE alias). This color will be lost, however, if you have a weather station hooked up to COM2, since it re-writes the POSIT string every few minutes. Also, every time you switch from HF to VHF or the reverse, your ALIAS is re-written to RELAY or ECHO.

SEE README.HF for setting up your UNPROTO path for HF and HF/VHF gateways..
--------TexNet comment: appears to be irrelevant to the node----------

Rendered body type: text/plain

Hello gang...

Well, it's almost time for the Digital Communication Conference, and again I will be driving. An unusual drive, since I will go, quite literally, from one corner of the country to the other (Key West to Seattle). I will be running APRS on both HF and VHF all the way. The van also has a second HF rig for voice, a station for normal packet, and a dual band rig for VHF/UHF voice. Then there are the two computers (connected via an AppleTalk network), CD ROM drive, cell phone, audio CD changer...you get the idea. After the conference I'll head south down the coast to Southern Cal to visit friends and family, and finally take I-8/10 home in a mad rush to get back before I have to go back to work. Here is the itinerary...

Fri 9/13 Miami, Orlando, Atlanta
Sat 9/14 Nashville, St. Louis, Kansas City
Sun 9/15 Omaha. Souix Falls
Mon 9/16 Badlands Nat'l Park, Mt Rushmore
Tue 9/17, Wed 9/18 Yellowstone Nat'l Park
Thu 9/19 to Sun 9/22 Seattle
Sun 9/22 Olympic Nat'l Park, Port Angeles
Mon 9/23 Ho Rain Forest, Portland, Redwood Nat'l Park
Tue 9/24 Golden Gate
Wed 9/25 Carmel
Thu 9/26 San Luis Obisbo, Santa Barbara, Ventura (Mom's house)
Fri 9/27 to Sun 9/29 Family stuff!
Mon 9/30 LA
Tue 10/1 San Diego
Wed 10/2 Tuscon, El Paso
Thu 10/3 San Antonio, Houston
Fri 10/4 New Orleans, Mobile, Tallahassee, Orlando
Sat 10/5 Home sweet home.

All this is subject to change, as for most of it I'm just out having a good time sightseeing. I'd like to hear from folks along the route, especially about favored voice repeaters, packet channels, and non-standard APRS 2 meter frequencies. I'd also enjoy visiting with APRS'ers along the way, so let me know if you are interested.

I'll have a computer in view while I'm driving, and of course, MacAPRS speaks incoming messages to me, so I'll get your mail. The driving comes first, so I may not be able to answer you right away! And whenever I get to a phone I'll be checking my email here. Also, there will be a javAPRS page displaying the trip (not up yet, but before I leave), with archived data as I get a chance to upload it, and live data from Dale's

server...hopefully at least some of my packets will get through a GATE in
Atlanta, and the server has a special feature that holds onto a few
packets from KO4HD-9 longer than others!

http://wa4dsy-3.wa4dsy.radio.org/Xaprs/trip.html

Hope to see you out there!

Steve KO4HD

On Fri, 6 Sep 1996, Robert B. Morgan wrote about his mods to support APRS
UI frames in his TEXNET code:

> ----For TexNet, it should be feasible to define a radio port to
>     not permit connected mode operations based on application...
>     ... should we permit a weather spotter to have a connect QSO with
>     an EOC or NWS net?

*** REPLY:  Good question.  If TexNet operates on the principal of
user freqs separate from link freqs, then a complete network can be
dedicated to WX and emergency services alone, and the user freqs can be
all different.  And then I think that user keyboard connects can and
should be supported.  This is along the idea of WX is a fixed site kinda
thing. But as soon as you want to track mobiles, you are back to wanting
a single freq...  But if only user end packets are on the freq, without
the duplicity of digipeates (beacuse the nodes are backboning all of the
DX trafic, then I think user keyboard node connects could also be
supported on the same freq...

> ------TexNet comment:  The callsign structure of the code lends itself

>     live data acq (wx sta, etc) on node-site, would that data go into this
>     frame also?   Or a different frame? -----------------------------

APRSdos REPLY/COMMENT: Fixed in EPROM is fine. the position never changes.
Any additional BEACON will also be captured by all APRS stations, so you
can independently sned out other live packets too.  If it is raw WX in the
U-II format, then APRS will capture that WX data and re-assemble your
POSIT/WX report on the receive end.  If it is ANY OTHER packet not
otherwise recognized as an APRS format, then it will be captured and will
overwrite the single line display for that station on my LATEST-LIST.

In otherwords, othern than stn-to-stn messages and bulletins, APRS only
```

captures and retains TWO packets per station. One is the POSIT (which can contain WX) and the other is ANYTHING ELSE. Oh, there are two more. An ID packet is retained if it is the first packet heard, but ignored all other times, and an APRS TELEMETRY packet is separately captured and displayed on the TELEMETRY page. Here is where you can reports lots of stuff going on at the node site. 5 Anaolg values and 8 bits of status...

192. Re: [APRSSIG:4461] part 3/4 APRS L3 (TexNet)

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 6 Sep 1996 11:22:48 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.960906103549.29016C-100000@arctic>
Rendered body type: text/plain

On Fri, 6 Sep 1996, Robert B. Morgan continued to write about the WIDE-N algorithm and other aspects for consideration in TexNet:

> -----TexNet comment: I will have to think about this one carefully, of the node. Also, I am unsure how the FCS compare would work for us if the packet is modified from one repeat to the next.

*** APR REPLY: True, you would have to do a CHECKSUM on only the INFO part of the packet, since the DIGI fields will be changing.

> The file refers to ssid-s 7 and below, implying that 8-15 are reserved by something somewhere...

*** APR REPLY: The 4th bit indicates "directional digipeating". If it is set, then the 1st and 2nd bits indicate one of four directions N, S, E, or West and the 3rd bit indicates DX or not. DX means to forward the packet in the given direction one extra hop at the end... For this to work, each digi (or node) has 4 preset paths for each cardinal direction. It selects one of those unproto paths to add to the packet. IF DX bit is set, then it adds a WIDE at the end.

> APR DESCRIPTION of LEVEL 3/4 ROUTING: ....is to have the NODES do all UI frame routing. The APRS station simply sends his UI frame TO APRS VIA HOME; Any NODE hearing that transmission that has knowledge of the route to HOME, will send the single packet via the NODE network to the HOME node!
>
> ------TexNet comment: This is the basic method I would like to implement, but as explained earlier I don't have a real friendly way to specify "HOME" in a way that it will relate to some destination network node without making it cryptic to the user.

*** APR REPLY: The word "HOME" is the network name of the NODE closest to his house or wherever he wants his reports to go. If it is DALLAS, and there is a node named DALLAS then he would send his UI packets TO APRS VIA DALLAS...

> ------TexNet comment: The idea of mobiles transmitting the same address string as they drive from node to node is probably just fine. The idea of sending the direct path only downline on the network assumes that the network node site will unconditionally be able to hear mobiles, and they won't need a relay.

APR COMMENT: I think direct only, or keep a copy of the LAST heard packet and compare only to that one. When you hear the direct and a digipeated packet, they almost 100% always occur back to back because a digi packet gets priority...

> ------TexNet comment: TexNet has a provision for a sysop-controlled network-wide alert mode. When enabled, new connects are greeted with an extra message on the screen that the network is handling emergency traffic at node: xxxxxxx and to disconnect if you aren't participating, also the behavior of the network idle-user-timeout is inverted, and the PMS will deliver automatically to an addressee if he is on the server. Other things could be tied to it if necessary. My logic is based on the assumption that TexNet APRS support would exist on an existing network common with other applications, but ought to be configureable to accomodate the priorities of a parallel and dedicated APRS network. Comments?---------------
>

APRS REPLY/COMMENT: In my humble opinion, I think ALL networks might
consider handling a minimum level of UI position reports...???

Message-ID: <Pine.GSO.3.95.960906112316.29016D-100000@arctic>
Rendered body type: text/plain

```
On Fri, 6 Sep 1996, Robert B. Morgan wrote a final whole mouthfull
about APRS in TexNet:

> First, I need to know what the APRS I-field length limits are.

*** APR REPLY: Maximum length of the data field is currently on the order
of 80 limited by the current (and not likely to change) display pages
of the DOS implementation..   lemme check for sure...

> Second, I need to discuss routing.  I presume it would
> recognize that a UI addressed to APRS needed to be processed.

*** APR REPLY:  Currently there are lots of acceptible TO addresses.
THese have been expanded so that "subnets" of activity can take place on
the same frequency independent of each other.  In this case, it could be
used to indicate that a person desires to have his packets go via TEXNET
by addressing them there.  Or you could accept several such as SKYWRN,
APRS, SPCL, etc and even use these flags to slightly modify NODE handling
of the packet.

> schemes, these may need to be processed.  Then that brings up the
> question of duplications and whether or not to repeat them
> and how to filter them if so.  I detest the idea of holding
> on to copies of packets already processed. ...   (One possibility is to
> COMPUTE an independent checksum of just the I-field, instead
> of juggling the FCS from the SIO/SCC

*** APR REPLY:  Yes, simple checksum of I-field only...
>
> Next issue is the form of the destination specification.
> It could be a default for each node.

*** APR REPLY:  No, user always specifies the ultimate destination...
usualy the NODE name closest to where he wants his reports to go..

> There may be cases it may be desired to "broadcast" to more
> than one destination node....

*** APR REPLY:  This is needed and is a challenge.  I think it can be
simplified to just a few possibilities:
   1) PRESENT NODE ( I think that all nodes should digi the original
      packet to others in the local area as a matter of routine)
   2) LOCAL AREA:  It is broadcast to all adjacent NODES (one hop)
   3) WIDE AREA:   It is broadcast out two hops in all directions
   4) EMERGENCY:   THis is only possible via SYSOP.  GOes everywhere
Anything beyond the WIDE AREA should use a directed packet to a given
node, such as the state EOC or something like that...

> I presume that under some if not all circumstances, it might
> be desireable to locally repeat the inbound APRS packet as any
> other WIDE or WIDE-N digi might do...

*** APR REPLY:  Yes, I agree..
>
> A little bit of info on parameters and options.  TexNet
> is primarily an EPROM parameter system...  WHich parameters need to be
> remotely configurable?

*** APR REPLY:  I see no reason why most are not permanent... (worst case)
but some may need to be remote..

It looks like you have everything pretty well covered Steve. The
itinerary looks swell also.

OOps what about 6 meters? How about communications with the truckers
for local road conditions? Ha! enjoy.

73, KD4FJ George.

I hate to say it, but you moved there. There is such a thing as
installing a digi somewhere else near your location. To many depend on a
very few to do all the work and spend the money to install digi's at
great expense then just sit back and complain because they can't hit them
with a rubber ducky hooked to an HT. Maybe if some folks would start
supporting the installations of those didi's you wouls see more of them
(Closer to your location Hi). I also noticed this with registering APRS.
There are some that i know of that have been using APRS for several
years, but just refuse to spend a couple of dollars to register the
software, but then complain because something isn't working to their
liking. Good morning Sig.

The mouse problem was found to occur whenever you went past midnight for
sure! (but you implied it takes less time... hummh...) But was clearly a
clock rollover problemmm

Can you make it occur some time other than after a midnight has passed?

I also suspect that it will occur if you reset the clock to anytime
EARLIER than current time...

197. Minuturization Efforts?

From: robert <rambrose@unm.edu>
Date: Fri, 6 Sep 1996 13:14:26 -0900 (PDT)
To: APRS SIG <aprssig@tapr.org>
Message-ID: <Pine.PCW.3.91.960906130108.6575B-100000@ppp_056.unm.edu>
Rendered body type: text/plain

Does anyone know if there are any efforts to miniturize a GPS
recevier, TNC, and transmitter into an extremely small package that
could be carried by a bird? No, I'm not crazy, please read on. In
addtion to being a Ham, I am also falconer. Telemetry is
currently used by falconers to locate lost birds so equipped. Use of
APRS for this purpose would be enormously more productive by an order of
magnitude!

I'm currently in the middle of an argument with other falconers
about this possibilty. Most don't have the faintest idea about GPSs,

TNCs, or APRS, and it's tough convincing them that "real time" tracking
is possible without thousands of dollars expense.

I'm facinated about this potential and unique application of APRS.
Please let me know your thoughts.

I thought it might have been related to a long period of keyboard inactivity, as it only happened when I left the software running overnight. I didn't think about the clock rollover.

This brings up another minor bug. When it happened to me the first time (several months ago), I thought I was messing up, due to inexperience, but on the last evening of August, at about 2230 local, it happened again. I was entering new data from an NWS advisory of 010300z. APRS was dead reckoning the storm position for about 2 extra days movement (I don't remember exactly how much it figured out to be, but it was more than 24 hours extra). I worked around it by entering the report time in local time. After midnight, when the computer date turned over, I re-entered the data using zulu time and the problem no longer existed.

regards,
Joe

Rendered body type: text/plain

Bob, I've been using your program (registered of course) for a year and a half and have NEVER complained about APRS. Well....... here is my first complaint!

My closest neighbor, who lives 2 miles away, comes home from work about 2 a.m. each morning. He invariably wakes up his wife, who happens to be pregnant. So, she gets up and relieves herself. The flushing of the toilet, however, also wakes up half of his 12 other kids, who also have to get up and relieve themselves. Now, with all this going on, thier family dog thinks it's morning so he begins to bark. The barking of a neighoring dog is all that my 13 hounds can stand and must reply in an excited state. Hearing all this barking, my grandmother, who lives across the holler, wakes up and instantly thinks someone is "snooping" around. So, naturally she picks up the phone and calls the neighbors "to see if they saw anything". Then after 10 minutes of talking she hangs up and calls me. I naturally have been sound asleep, oblivious of the "houndspeak" going on outside, and wake up to the sweet sound of a telephone ringing by the bed. I then reach over to pick up the phone, but instead hit the mike button on the 2 meter radio. This causes the repeater to i.d. and I, not wanting to be a curchunker, must also i.d.

OK, so how does APRS fit in all this? What's the problem? Well, the problem is that at 2:30 a.m., when grandma is barking in one ear and the hounds are barking at the neighbors dogs and I'm shouting at the dogs to shut up, I can't resist looking at the (H)eard list screen! And THAT is the problem! It has become a habit! At 2:30 am the propogation is so good that I can hit St. Louis and Kansas City at the same time. So, the REAL problem is, that I can't leave it alone! I've got to sit there and play with this thingy till I either fall back asleep at the keyboard or it's daylight! Shame on you, Bob! This thing is still too much fun!

BTW, This DID happen a few nights ago and I really DO have 13 hounds!

201. Power supply protection for the GPS-20

From: Joe Scalet - WK0G <jscalet@sound.net>
Date: Fri, 06 Sep 1996 16:13:47 -0500
To: aprssig@tapr.org
Message-ID: <3230940B.671F@sound.net>
Rendered body type: text/plain

I had my GPS-20 up and running for the last two months and have been very pleased with it. About two weeks ago I went to turn it off and noticed the dicast case above the GPS-20 board was getting very hot. Strangely,where the regulator was heat sinked the case was cool. At this point I noticed the GPS-20 had quit working. When I took the case apart the GPS-20 was still very hot. It had gotten hot enough that the labels on it had melted. Further investigation revealed that the 5V regualator was a dead short and the full 12 volts of the car power supply had dumped into the GPS-20. Garmin was very helpful and swapped the unit for $45.00 exchange for a new one. This was especially convenient since I only live 3 blocks from Garmin's new headqaurters.

When I first packaged the unit I thought about incorporating some sort of power supply protection but got in a hurry and didn't. Besides the cigarette lighter plug had a one amp fuse in it and I had added the usual caps and ferrite beads between the three terminals. In the past I had never had a problem with these regulators. Surprise ! The dead GPS-20 only drew 600ma at 13.2 volts so the fuse never blew.

I decided to incorporate some sort of fail safe protection for the new unit. I bread boarded a zener and an SCR as a "crowbar" to blow the supply fuse if the power supply went high. The problem with this is that you need to incorporate a darlington pair to get the circuit to turn on hard enough to protect the GPS-20. It is also hard to get this set up to trigger at a precise voltage (example 5 volts plus 5% to stay within the Garmin spec of 5volts +/- 5%.). A zener does not make a very good voltage refernce !.

I'm always one to avoid reinventing the wheel so with a little research I came across the Motrola MC3423 Overvoltage Crowbar Sensing Circuit. All you need to use this little jewel is the chip itself (an 8 pin dip that can accept a supply voltage of 4.5 to 40 volts) 2 esistors (three if the trip voltage is to be abouve 11 volts) and an SCR plus whatever you want to use to interupt the current flow (ex. a fuse, a mosfet, a circuit breaker, etc.). The MC3423 can be across the GPS-20 input and the SCR can be placed before the voltage regulator if you want. The chip even has output for an indicator if you want.

        The problem was finding a source for these chips that would sell to an end user. Plus there is the added cost of shipping, minimum order size etc. I ordered a tube of 50 of these chips because I have a number of uses for them and shipping was half the cost. If any one wants one and doesn't want to got to the trouble of tracking them down I'll make some available pretested with the 2 resistors to set it for around 5.4 to 5.5 volts plus copies of the data sheets from Motorola for $3 postage included. I figure that will just cover my cost of copying and mailing and running around to get the rest of the parts. You can get the SCR and fuse or whatever at Radio Shack. If you want one or more of these please email me directly at jscalet@sound.net. I will then give you my snail mail address. Do not reply in care of the forumn please.

Having ruggedized a package that was placed on a herd of cows, I've some ideas about something like this.

I think that, using a MIM module and a GPS, you sought to be able to get something started. You'd probably end up using something like a Motorola VP OnCore 8 channel receiver. It's a 5volt receiver, and talks TTL levels.

Wasn't there something (Joe Argelo?) about a TNC (transmit only) and low power transmitter on a chip? That's another ideal application tool.

The gotcha will be battery. I've done some work with that, and think you will have to develope some timing mechanism where the thing fires off every _n_ minutes for _x_ minutes, and shuts back down. GPS receivers are power hogs.

All in all, some of the miniturization issues are coming together. Trimble has GPS on a PCMCIA card, so it's pretty small. Motorola announced a GPS on a single monolithic chip about 18 months ago. Getting the data transmitted, as well as collaring the birds for the hardwre, plus power requirements, strike me as the challenges.

>unit?

Maybe just a difference in terminolgy. In my head, I consider the 40 and other variations on the 45 engine a marine unit like the 45. The 35/trackpack and its cousins the 20 engine, etc I consider to be land units. The 90 and 100 (I think the 100 is the indash aviation unit, but I could be wrong) I consider to be aviation units.

>
>BTW, if anybody out there has built some interesting
>device with a GPS20, you won't believe how much better
>the GPS25 board is! Wow!

I have been using the 35 and think it is pretty fantastic, and I think it is
a 20 engine. Is there a trackpack made of the 25?

I had some GPS 35 trackpack/KPC-3 combinations here that were only used 3
weeks during a major summer sporting event that had no events in Cobb
County. We sold the packages for 350.00 each. Pretty good deal, eh?

If anymore become available, I'll notify the SIG.

Rendered body type: text/plain

```
I've been working toward being able to setup my TNC and Ultimeter 2000 to do
their thing sans computer.  Well, tonight, I've finally had some success.  I
ended up using the GPS mode of my PK232.  Before that, I tried using the
Ultimeter's packet mode.  I had that working just fine from my station's
point of view.  However, I had (DOS)APRS running in another part of the
house to monitor what's going on.  When APRS received the WX packet, it
apparently caused some sort of parsing error which displayed in the middle
of the map.  I didn't write down the actual message but it seemed to refer
to some parsing subsystem, gave some info, and asked if I wanted to continue
or quit.

Any ideas, Bob?  BTW, running 7.6f.

Also, I've been playing with mapfix to make some of my own maps.  I started
doing it on our "main" computer, a 486-120 with 32MB.  It was excrutiatingly
slow, especially the mouse operation.  The mouse was nearly unusable.  I
later ran it on the shack computer, a 486DX33, and it ran just fine.  I've
also noticed that APRS itself suffers some of the same symptoms but to a
lesser degree.

Thanks and 73.

Well, not everyone can move anywhere they want.  Having antennas is a
consideration of where I live, but not the deciding factor.  We have a good
digi here in Largo, Florida (KF4FOH-10) at this time sponsored by the local
RACES group.  It is quite usuable on fairly low power all over.

>There are some that i know of that have been using APRS for several

I know there are ungrateful people.  I co-sysop a BBS, and the biggest
whiners don't do a darn thing but whine but its their consience and not mine.

Luckly, it seems, the majority of regular APRS users in this area are
registered.  We did a group registration last year and we hope to be able to
```

provide a registration site at the Suncoast Convention in Tampa in November.

209. Re: part 1/4 APRS L3 (TexNet)

From: morganb@admin.inetport.com (Robert B. Morgan)
Date: Fri, 6 Sep 1996 20:53:25 -0500
To: aprssig@tapr.org
Message-ID: <199609070153.UAA03201@admin.inetport.com>
Rendered body type: text/plain

Well, I have posted part 1/4 TWICE, and it hasn't turned up. I am beginning to guess that the SIG must have some sort of filesize limit, as it happens to be about 18K and the other 3 were 10-12K. (It didn't seem to bother those executables that were posted a couple of weeks ago, or maybe it is a new limit? Or maybe something else is wrong.)

If THIS little msg propagates successfully, I will go back and split part 1/4 into a 1A/4 and a 1B/4, and repost it that way. That first file was the one which had the general comments that were consolidated from this SIG. Stay tuned.

Comment to APR. TexNet has been designed and applied from the beginning as a separate user and trunk system. It is intended to support multiple users at 1200b by use of a 9600b common trunk. We have very actively discouraged the implementation of a trunk on the user frequency in direct competition with its users. The trunk wins hands down every time, and I suppose it stabilizes on a busy channel where it limits traffic on the trunk by pushing users off the frequency. (Does this sound familiar to anyone? If it does, separate the trunks!)

We started out applying one user freq in a locality. It could be anywhere, at local discretion, on any band. In larger traffic locales, we have added ports either on the same node, or added nodes as necessary, to add ports to support BBS forwarding, and later on did the same thing with additional ports in some locales to support DXC networking. I would presume the next logical thing would be to add some APRS ports (and I am not speaking for any other except myself here). Decisions to add ports to OUR own network rests with those who support it, which is our policy at TPRS to be a local matter. Of course, anyone can go put up a parallel network.

Presently, as far as I am aware, we don't have any user ports on 145.79.

Subject: Re: [APRSSIG:4135] APRS L3 Networking (TexNet)

Hi Bob de Dave/WH6YC qth Seattle. I lived in San Angelo for 3 years and was the APRS coordinator for TX while there. I don't know who's got the glamorous job now. I created a number of TX maps, and GPS error corrected many of them while driving, primarily, in WTX. Maps I have have been posted to the TAPR APRS SIG something like TXMAPS##.ZIP. I think I may have some updates since then. Good luck with the TEXNET-APRS connectivity. You may try KB5EDB/David Eaton in San Angelo, or AA5PK/Glenn Miller also in San Angelo. They are both avid APRS people. There is also a WX station on their system, which is on 145.01, digi thru SAG. Let me know if I can be of further assistance. Dave.

--------thanks Dave (Jim WA5LHS got me started in APRS)--------

Subject: Re: [APRSSIG:4135] APRS L3 Networking (TexNet)

Seems to me the best way to interface the transport layer to APRS is to put
the TEXNET or other L3 stuff in the Middle of the digi path- I E
KG5QD>APRS,Wide,Wide,(Texnet input node name), (TexNet output Node),Wide
,Wide:[data]
Texnet node recognizes its call(or Name) in a <UI> frame - then encapsulates
the
Sending call along with the rest of the digi path after the TexNet output
node call
--and the data in the aprs packet-- in a standard ax.25 connected packet AS
DATA--
then on the other end the output TexNet Node strips the L3 stuff back off--
bit shifts and all that stuff the Header left in the Data --and sends it on
the aprs freq as a <UI>
frame . The sending station has control over the path as far as the Aprs and
will not care how the TexNet part gets there. The area where the packet
orginated will see
the packet digi-ed only as far as the input node call where the "sent Bit"
will not be set so no more repeats.
The packet can have up to 8 Digis- so this scheme would allow 3 on each end
with
2 for the L3 layer.
Best of Luck on this project 73 de kg5qd Dale Marco Island Fl (U T Ex)

---------reply comments-----------
This one is different, and brings up some real issues. First,
I don't want to sound like I am replying negatively, but
it raises some issues that I don't think I can handle, or at
least on a first approach. I still want to thank Dale for
the comments. As for the issues, they needed to be addressed
anyway.

There are several concern areas here, not the least of
which is the 8-digi field. Way back when (as Harry N0CCW says,
when the world was flat) when TexNet originated, as of course
a connected networking alternative to digipeating of
connected stations in a crowded environment, digipeating
out to 8 repeats was unworkable. W3IWI wrote a classic treatise
on the exponential failure of multihop digis past about 3 or
so repeaters. TexNet has a RAM memory structure which trades
I-field buffer memory against the number of possible repeat
fields in the address space, and we set the address length
field at a maximum of 4 digis, since any more than that
were unusable from a practical standpoint anyhow. So any packet
that comes along with 5 or more digis is pitched out, in
fact it aborts the reception when the address field gets
past that point. It can be made longer by specifying a
variable during the compile process, but I don't know that I
am ready to change it for lots of reasons, the biggest of
which is the performance cost of less memory space to buffer
up packets in a queue for the trunks. I recognize that using
the address fields here is actually splitting the digipeat
process in such a way as to make it much more reliable, so
that isn't the issue here. The fields are just being used to
contribute routing information, not to launch more digipeats
into the ether to step on each other.
Next comment is that splitting the field in half implies
that the second half of the address field is to be shipped
to the destination to be reused for further addressing. THAT
implies that the L3 datagram has to carry the address info
in addition to the I-field, and that brings up the question of
how long the I-field is, for ANY APRS transmission. First,
I have to subtract 5 bytes of overhead for a L3 datagram
header (destination node/user, source node/user, and function
code), which leaves 251 bytes max. Now if I have to subtract
7 bytes for each required field, which could be up to maybe
6 or 7 addresses, that could be another 49 bytes, leaving
around 200 or so. I have skimmed over the APRS doc's but I would
like Bob Bruniga or someone to tell me a definitive number
of bytes that APRS would ever send in one packet. Maybe it
is already 256, if so, we are looking at a possible problem,
since I have to subtract 5 bytes at a very minimum.
Next comment I have to make, which is necessary at this point,
is the issue of packet splitting. TexNet has to split
any (connected) user packet for transmission on the network if
it happens to exceed 251 bytes. If it does, it splits it

roughly in half, and prefixes the L3 header to each, and squirts
both of them down the trunk. At present, we don't bother to
glue them back together, we assume that all users are working
off a bytestream of I fields. That isn't true of TCP-IP
connects, which is why they don't work on TexNet. That issue
is one I am trying to solve now, and it is somewhat related
to this issue, although it may not be apparent to outsiders.
It revolves around the addressing methods and space allocations
and whether or not to re-assemble split packets, etc. I
anticipate solving both problems together in the same release.
The direct issue here is whether or not to split a UI
packet for transmission over the network, and my first
approach is instintively not to do so. Here's why-
Presumeably the APRS receive user has to have a one-to-one
correspondence between the packet address header and the
represented data. It expects one full I-field on each, not
a split pair of packets with half the data in each. So they
would have to be glued back together. Since it is UI this
implies: no user circuit table at the destination and no
guaranteed delivery was intended.   Since it is a UI, no
assurance that there is a mechanism to establish what to
do with multiple split packets arriving from more than one
sourcenode, and some possible demands for memory buffer to
hold the first half waiting for the second, if it ever could be
determined which halves went together. ALSO, there will
probably be some sort of priority mechanism as suggested in
some of the existing APRS docs, so as to not overload the
network with too many UI's. I have a mechanism now that
can be used to determine if the node has some free memory
for discretionary acceptance of data, and it will have
to be used to determine if the APRS UI's will be accepted or
rejected to begin with, also to determine if the packets
will continue to be forwarded at all intermediate nodes.
If I don't do that, the network could be swamped to shutoff
by too many UI's input to it, so I have to implement this
to protect itself. Then THAT raises the question of what to
do with the half of a packet that does make it to a destination
when it's other half has been deleted, never to arrive.
I can't store them or I will run out of memory. I can only
store the first half of split packets for Connected Stations,
not UI's, since these can be supervised by connection
terminations as failures occur. The memory is released
when a connected station loses connection. UI's provide none
of this, since they don't show up in a connection table.
So, I have to come around to the previous question: what will
the max I field of an APRS packet be? I can't make many
more steps in design planning without knowing. If for instance it
were around 80-100 bytes, there would be no problems forseen.
Or another approach is to recognize that feeding through
the network would limit the sender to a reduced length
in case we just decide to truncate at 251 bytes, or maybe some
lower number if we have to transport addressing.
---------guess that is the end of that reply, for now--------

Continued in part 2/4.

Well Paul there are ways to get gain antenna's that are compact enough to easely fit in the confined space of an attic, a 3 or 4 element yagi would take up very little room and would double or even tripple the range you get with a omni antenna. The thing i'm saying there's always a way to fix the problem other then 3 wides i think. Maybe that is the only way in some area's of the country but i'm sure glad they don't use it here.

Boy i am realy dissapointed in the lack of interest in helping others trying to get into APRS that may need some help with getting off to a good start. To many i think forget that they at one time or other have asked someone for help, but how quick we forget. I posted several messages asking for names to add to my dedicated APRS mentor page, Besides Bob Bruninga, Keith Sproul, there where 18 or so others that where good enough to come forward and say they would be glad to help a newcomer in need in their area. I see many messages about having meetings and get togethers, for what well i guess many drink beer so i think it would be better if it was called a beer party. Surely it's not to advance APRS because if that's what it was meant to do forget it. If those users aren't even willing to help someone just starting out in their own area what is such a meeting going to accomplish. I have dedicated, and worked hard on setting up a webpage just for APRS and to help those that need help, fellows that's the only way to make it grow in case you didn't know. It's not having a beer party that does that. I have decided that i'm fighting a loosing battle and will wipe my webpage off of the server since there doesn't seem to be much interest in that sort of thing. Instead i will devote it to something worth while. Thanks to those that did want to help.

Yes, you can order a TracPak with the GPS-25 (PhaseTrac 12) engine, according to a spec sheet I'm looking at.

One interesting thing strikes me: Under both the GPS-25 and GPS-20 engines it says input voltage is to be "5.0 volts DC +\-5% regulated". But under the TracPak column it says "Just connect TracPak to 10-30 bolts of DC power..." I guess when they put the engines into a TracPak they add the required voltage limiting and regulating circutry.

It appears that if you want the TracPak with the GPS-25 engine you order the model GPS-35.

Hi Bill,

On Sat, 7 Sep you were:

>Dissapointed
>
>... I'm fighting a loosing battle and will wipe my webpage off
>of the server ...

Aw, c'mon Bill. Isn't that throwing out the baby with the bathwater? There are those 18 of us that came forward and were willing to have their e-mail addresses PUBLISHED, and I'm sure there are plenty more of us that do exactly the same thing you and I do when we see a new station on the screen but, for one reason or another, DON'T care to dissemniate their e-mail address any more than absolutely necessary. Perhaps they're concerned about spamming, maybe they don't check their mail very often (how many on the SIG just check the mail once a week,) or any one of a myraid of reasons.

You know as well as I that the great majority of hams are always (oh, okay ... USUALLY) willing and glad to offer a hand to the newbie, to increase his proficiency, promote the hobby and encourage good operating practices. This is the ancient (in electronics & computer terms) concept known as ELMERING.

I've only been in this hobby for a couple of years and was NOT elmered in. I had to learn it myself. After I got my ticket and was on the air I was delighted by the amounts of assistance I received when I stepped on my own (or others'!) toes or put my foot in my mouth. All of us have, at one time or another, received such hand-holding.

So please don't be disappointed by what you see here on the SIG. There are LOTS more of us out here than you may realize. They just may be reluctant to have their e-mail boxes filled with what may seem like inane questions on APRS. Some years ago I learned an important lesson about such questions: The only "stupid" questions are the ones that AREN'T ASKED!

In answer so your statement.....

Most of us are busy elmering new stations in our own areas,
we know when a new station comes on the air and climb all
over them to assist.
We have a strong District group here in East Panhandle, and
are connected by a vhf net that will reach the whole District.
When a station wants to begin operating APRS, all they have
to do is mention it on the net.
I think your webpage idea is great but how many NEW APRS
stations know to check into the webpage or the TAPR group?
Keep up the good work.

That is true.  Luckly I'm not in the situation.  The only time WideX3 is
used here is if something very important needs to get out to a large area.

After seeing Dale's javAPRS application in metro Atlanta, I can see why
wideX3 would be a problem in land'o'big mountains.... and not small hills.

Here to get 150 miles we have to direct our packets to at least 3 digis, and
sometimes 4.  At night we can see alot of Florida but during the day we
don't see Orlando much even.

Also where the wides are located has a great deal to do with what you can
and cannot do.  Being on the west coast I can direct my packets easier than
someone in Lakeland or Orlando who wants to go both ways across Florida.  We
don't hear the Orlando digi here frequently but we do hear Lakeland,
Sarasota and Brooksville (and the deaf Tampa digi) so we can get around.
Our network isn't busy by any stretch of the imagination though.  Compared
to AL/GA/TN we're pretty scarce really.  Though from Key West up to Palm
Beach they are a bit ahead of us in population of the APRS network.  Still
our usage isn't extremely high.  yet.... maybe after the coming hamfests
this year where APRS'ers will be promoting our favorite packet application!

Hi to the SIG. Due to non-availability of a local access number where I now
live, I've had to change my e-mail address. For those of you who have me in
their address book, the new address is: ddobbins@juno.com.

Thanks. Dave/WH6YC.

I am working on a person portable tacker in the same vain as your
Cows-In-Space project Gerry. Batteries are definiately teh problem. I
wanted to have GPS running continuously and a 5 watt transmitter as
well. The MIM with a GPS-20 and Maxon form the basis for my package.
The MIM,20 and Maxon fit into a reasonably small box. The remainder of
the space is taken up by two 12 volt 3 amp-hour batteries. One for the
GPS/MIM and the other for the Maxon. This takes up three fourths of the
space in the enclosure of my system. Your idea is the way to go to
conserve battery power.

I firmly agree with a NEED to be able to keyboard with another
user<<<<BUT>>>> the biggest problem I have seen is the users inability,
or lack of interest, in changing UNPROTO paths FOR THE OCCASION.

An example UNPROTO of via N3ZZZ,WIDE,WIDE should be fine for a general
beacon, but if a keyboarding opportunity occurs, the user should know
how, and be willing to IMMEDIATELY shorten or alter their UNPROTO
accordingly. When 73's are given, the UNPROTO could be changed back to
a generic beacon format which is acceptable for that area.

Rendered body type: text/plain

This was the one thing that I was always wondering about when APRS finally
was going to go "backbone". I know it is a problem and Dale has some good
ideas but....

Don't take this as being negative from here also but... (again) do we really
think that some (many maybe most) of the APRS users could handle such a
system. I don't want to be rough on anyone but the truth is that many of the
users that I have spoken with or seen on the air have NO IDEA what a UI
FRAME or UNPROTO path is! The majority of the ones that do are old timers
like me that were on packet before anyone even dreamed of the word NODE, and
BBS's were still run on TRS-80's!

Many now have learned that you set your UNPROTO to APRS VIA

```
WIDE,WIDE,GATE,GATE,WIDE,WIDE or APRS VIA WIDE,WIDE,WIDE,WIDE that is why
they get out. (PLEASE PEOPLE DO THIS BUT DO NOT DO THIS YOURSELF!) They have
learned or seen this in use and now they use it but how many station that
you know  do understand that if you go WIDE,GATE and there is no WIDE you
will never get to a GATE.Not because the GATE is too far, the GATE can be
next door but because the path has been broken.  Heck I have seen an awful
lot of people recently using RELAY,GATE and WIDE,GATE on HF. I think that
unless someone comes up of a GREAT way of teaching everyone what is going on
with UNPROTO paths and UI Frames that such a system will be way too
difficult for many to comprehend. There may not be a better way than Dale's
approach, or maybe there is but something has got to be done.

You are so right AL. Whenever i keyboard locally i use a path of None
whenever i see i can hear that user direct, if not i use the local digi
path only, also i make it a point to switch antenna's when needed, from a
simple Discone at 30 ft and 1 watt to my stacked 13B2's and  300watt. But i
have noticed this also that many users NEVER change their path. I see
messages coming out of Florida that where meant to stay local, and i'm as
far north as you can go in Alabama.

Ok Mike, great to hear things like that. I have had many messages of
support so have decided to leave it up for a while longer to see if it does
any good or not. Yes you and others have convinced me that i may have been
jumping the gun because it does take a while to buildup something like that
i suppose. Again Thanks Mike, and all the other users that have sent
messages of support.

Hi Dave,

Is that effective after this message?  I need to know, since I have
been keeping in touch with you for the PNW APRS happenings here
in my neck of the woods... I thought that I would send it to the SIG,
so that you would see this one way or another.  I currently have your
AOL address in my address book... Please advise.

73 - Stacey

```
Bob, I have noticed on version 7.7 that the mixed upper/lower case in the
Wx beacon

My station is showing the following after the normal location info
_289/000/T076/R000p000b0107h00g000U2k

I have also noted that no matter how you enter the beacon comments, it is
stored as uppercase characters..

Just a little think BOB, but maybe something you may want to fix before 77a
release..

Thanks
Don
AE4BR
```

Strange i have been running version 77 and haven't seen that problem. Maybe
system related.

The APRS program has a neat feature - it will store up to 10 different
digi paths,
using the Opps-Digi command...with 2-letter designators for each path.
When
using this method type in the callsign of the station you are sending to
followed
by the designator.   AB3XZY/AB [for example].  this makes it easy to
change
paths to the stations you are communicating with.  Works great.

Hi Bill

I think that newbi's like me will get up to speed and join the list. It
( the list  ) should grow over time. I also believe that perhaps a post
on the newsgroup rec.radio.amateur.digital.misc might help to get more
people involved. Personally I would gage the success of your list buy
how many people access and use it to get involved than by how many sign
up to be Elmers. I think that the current lack of elmering is the
biggest problem we as a group (amateur radio)have. so i would encourage
all who can help to do so and I would certainly send you an "ATA BOY"
for your efforts!!!

73 & keep up the good work!

John

241. Another 7.7 Bug?

From: Arte Booten <N2ZRC@gnn.com>
Date: Sun, 08 Sep 1996 10:03:32
To: aprssig@tapr.org
Cc: help@paccomm.com
Message-ID: <199609081404.KAA00784@mail-e2b-service.gnn.com>
Rendered body type: text/plain

Hi Bob,

I think I've noticed a bug in APRS version 7.7 concerning my GPS position. I look at the screen first thing in the morning and find I've "grayed-out." This happens after I've been running APRS for several days (ie: it doesn't seem to happen every midnight) and I've tried to Alt-S-T(nc) to no avail.

I've also O(perations)-C(omms)-T(nc)'d to manually reset the TNC's parameters with the same result. While I'm in this screen, I see that APRS hasn't properly set the TNC's U(nproto), as if it's truncating the information it's sending during the Alt-S-T(nc) I'd tried earler.

When this happens, APRS is not getting (or maybe it's not recognizing) the $GPGGA data from the TNC, as it's not transmitting a POSITion (either automatically by timer, or when I press X(mit)-P(osition,)) nor is the F8 key getting (or, at the least, not displaying) that information.

I did not look at the P(ositions) screen to see when my last valid position string was sent (this was before I'd had my coffee,) so I don't know exactly when this happened, but I'll be sure to look (now that I'm twigged to it) next time.

System specifications:

- Toshiba Satellite 105CS laptop computer
- 75 MHz Pentium processor
- 8 Mb EDO RAM
- Windows 95 build 950a
  - (all the latest updates from Micro$oft's website)
- APRS version 7.7 (with 1,925 maps ... getting there!)
- PaccComm PicoPacket Firmware release 3.2.10 (5/29/96)
  - (dual-port, battery pack version)
- Trimble S-Vee-Six GPS unit built into above TNC)

Oh, and I also noticed (this, I think, is unrelated to the above) the mouse (okay, that eraser-thing between the G, H & B keys) "coming back." I think (can't be sure) that it happened after a midnight had passed.

I hope the information above is sufficient. I'll try to see if there's anything I missed and advise you if I do. 73

I now have aprsair, I am trying to run it on a Toshiba 286 portable T3200.
The 3200 is a 286 with 4MB memory and a 20 MB disk. (a 1989 laptop).
I am using dos 6.22
I am running w/diskdbl.

Aprs run great no problems, with aprs air a get constant errors, the app seems to be looking for a file called aprs.dat. I can't find this file and see no way to generate it.
The eror is in the upper rt hand cor of the screen and writes over the beocon message with aprs.dat bad.

tns again for any help.

Rendered body type: text/plain

```
Hi

I have been trying to get WinAPRS to work with my GPS-45 and TNC
together, but have been very unsucsessful. I can get the TNC to work ok
by itself or the GPS to work by itself, but never the two together. I
tried using the DFjr/MPA/GPS45 with a single PC port, if I open TNC
under settings that works fine, I can see the GPS data at the bottom of
the screen as it comes in also. If I try to open the GPS port while the
VHF TNC port is open, I get a COMM PORT warning and visa versa. I guess
the problem is that you can only open one port at a time, I even have
GPS & TNC set to auto open under APRS settings.

What am I doing wrong?

Thanks

I have had the same problem.  I have edited the cfig77.apr file (where
the becon text is stored) so I can get lower case becon text on the air.

Visiting a new station (also the 1st station on the air in a new city), I drove to his DRIVEWAY and he still couldnt see me! We pulled our hair out, and his rig would hear otehr stations but ignore my packets.

How soon we forget..... I finally remembered that the stupid PK-12 (older version) does *NOT* display packets that it itself digipeats! (Is this still true? How about other AEA products???)

So of course, his station had the alias of RELAY, and sicne he was the only one in town, I was transmitting via RELAY... ERGO the PK-12 digipeated my packets but never passed them along to the PC!

I was in a rush to meet family committments, but we couldnt find the command in the manuual before I had to leave. But ther is a command in the PK-12 so that it will monitor packets that it digipeats, too bad it defaults to OFF!!!

(snip)

This thread has taken off in a COMPLETLY different direction from it
origination (I made the original post!)

Maybe I didn't say it clearly enough.....I repeat:

I see HF stations GATEing into my local area with MOSTLY Unproto paths
including WIDE,WIDE,WIDE.

I thought this was a NO NO. Why are HF stns doing this? (just because
they see EVERYONE else doing it?)

I HAVE noticed stations running 77 with the same format of WX data.
(still running 75 myself)

================================================================
Bob,

I have a 88 card and a pk900 and don't believe they will print to the
screen digipeated packets.
All I see is my rig s red tx lamp go on. Not real cool!
If anyone does know how to do this please let me know?

  To my knowledge, the MPA or HSP switched dont work with the windows
version of APRS(WinAPRS) yet. The only way I have gotten it to work is by
having a 2nd serial port available. I think I remember hearing guys that
have done it manually though. I had to buy a PCMCIA serial port card (about
$130) to have a 2nd serial port. I can not get it to work with the MPA or
Kantronics HSP or Paccom HSP. But the 2nd serial port worked fine.
   I don't think Keith and Mark have support yet active for a MPA or HSP.

 If you need one, check mail order catalogs. I couldnt find one locally and
check 7-8 stores. I found them in most catalogs though. I've noticed prices
from $119 up.

WinAPRS does NOT currently support HSP mode, last week I FINALLY made some
progress and now can say that it should be completed in a few more weeks.
```

Keith is going to the ARRL convention this weekend and the DCC the next
weekend, so it will be after that.

Would it be possible to add ALT-SETUP-MODE-SKYWARN? It was suggested (on
this sig) that we should set-up our own freq. Well, here in "hillbilly"
Arkansas that's not feasible or financially possible. (I know a few hams
around that still use "outdoor" pumbing! Needless to say that they also
use batteries!) I haven't looked but there may already be a WX modea but
that is fine for everyday weather monitoring. I'm suggesting a specific
SKYWARN for use in hurricans, tornados and such. Suggestions Please?

BTW, thanks for the replies to the "other" message! (Axuse de spell'n, I
iz edumecated in Arkysaw)

266. APRS SKYWARN

From: "J. Scott Ratchford, KC5JGV" <jratchf@bulldog.afsc.k12.ar.us>
Date: Mon, 9 Sep 1996 11:36:35 -0500
To: "aprssig taprorg" <aprssig@tapr.org>
Cc: "Jim Duncan" <ku0g@sprynet.com>, "Bob Bruninga" <wb4apr@amsat.org>
Message-ID: <199609091637.LAA15864@bulldog.afsc.k12.ar.us>
Rendered body type: text/plain

```
Please allow me to push this issue once again! Here in Arkansas we have a
broken down SKYWARN (Voice)Net. It all started out with good intensions
and actually worked for a while. However, it has ended up with disasterous
results. Skywarn storm spotters have been unable to report to the NWS
which either directly or indirectly resulted in deaths due to lack of
"public warnings". This is fact.

As an engineer, I can't stand to see a problem unresolved, such as this,
and feel it is our duty to solve this or drop the SKYWARN Net all
together. The latter in not feasable so we must try to find a solution. I
am proposing the APRS system for the following reasons:

IDEA: The SKYWARN Voice Net began two years ago as an idea that if you
installed a two meter radio in the NWS office and gave them the control
codes to a Central Net Control (CNC) repeater, which connects to any other
2m repeater in Ark, then they could advise and receive reports as needed.

PROBLEM: The NWS would connect to more than one repeater (in most cases
not by choice but by design) which caused numerous crashes on the net as
well as "unwanted" (I'll get to that in a min.) control by the CNC.
"Unwanted" was the term used by a club which was unable to disconnect the
repeater from the net when the storm had past and was "forced to listen to
the damn thing" as the storms continued across the state. (NOTE: The CNC
at one time stated that each repeater could be dropped at the will and
pleasure of the owners. Which didn't happen. So, this was a legit
```

complaint.) As it turned out the CNC repeater was privately owned and the owner shut it down after the above mentioned statment.
POSSIBLE SOLUTION: Just about every club here runs its own Emergency Net either through the local repeater and/or via local packet. Many are run through the local EC. The NWS continues today to train and have weather spotters courses all around the state. They continue to rely on hams (not as an "official" SKYWARN net) to spot storms, mainly in a local area around Little Rock. The NWS wishes to find a solution to the SKYWARN problem as quickly as possible. Enter APRS. I am to meet with the NWS in Little Rock to work out a packet solution. APRS will be my proposed backbone to the solution. It has already recieved a warm welcome by the NWS and many clubs around the state. However, again the problem arises about net crashes, control and activation.
QUESTIONS:
1. Is it possible to add to APRS a special mode called SKYWARN?
2. Is it possible to have a APRS SKYWARN NET remotely activated? In other words, the NWS calls a net by sending an activation code which in turn causes each station to report weather conditions automatically to the NWS.
3. Would all this need to be on a structured system such as the TexNet?

In part this is both a proposal and a fact gathering message. It could also be a basis for a siminar or workshop that can be held at a convention, such as an mid-america APRS convention if we have one!

I welcome all constructive comments and suggestions and realize that some if not most are not interested. And that I can understand and appreciate. However, please understand that this is a serious problem here and can be as much elsewhere. "nuff said"

73 and thanks in advance,

267. Update APRS L3 (TexNet)

From: morganb@admin.inetport.com (Robert B. Morgan)
Date: Mon, 9 Sep 1996 11:55:28 -0500
To: aprssig@tapr.org
Message-ID: <199609091655.LAA01193@admin.inetport.com>
Rendered body type: text/plain

Well, here's where we stand with the L3 investigation: I had given up trying to get the part 1A of last week's dissertation to post on the SIG. I checked with Greg Jones, he advised uploading to the aprssig/upload area. I spent a couple of hours tinkering with that unsuccessfully, so until I figure THAT job out, I may ship the whole thing to one of the locals who offered to stick it on a webpage of his (Lansing, KB5USG), and also e-mail part 1A to whoever individually requested it. I haven't the foggiest notion why it won't go onto the sig, but assume it is content related.
I originally wanted to post it all as one work, but the sig appears to be keeping me from doing it without fragmenting it up anyway.
Filesize is now less than the others that did post. Look for that later on in a day or so....

One matter has come up that I think is worthwhile discussing-

I think that Bob Bruniga may have just highly simplified the possible nightmares of network UI broadcast transporting, by boiling the requirements down to the following simple list. If indeed the requirements fit this concept, it looks entirely feasible. Read on...

Per Bob Bruniga:

```
>> There may be cases it may be desired to "broadcast" to more
>> than one destination node....
>
>*** APR REPLY:  This is needed and is a challenge.  I think it can be
>simplified to just a few possibilities:
>   1) PRESENT NODE ( I think that all nodes should digi the original
>      packet to others in the local area as a matter of routine)
>   2) LOCAL AREA:  It is broadcast to all adjacent NODES (one hop)
>   3) WIDE AREA:   It is broadcast out two hops in all directions
>   4) EMERGENCY:   THis is only possible via SYSOP.  GOes everywhere
>Anything beyond the WIDE AREA should use a directed packet to a given
>node, such as the state EOC or something like that...
```

With TexNet, this might be pretty feasible. I am pleased to say that item (4) was implemented in 1995 under vers 1.72 and later. It is hardcoded to send a UI to address of WX from an address of ARES on all ports of all nodes of the network (there is a provision for a state line or region partition). It does require SYSOP permission on the network, meaning of course that one must CONNECT to the network to use it. It also is triggered on an automated basis by the saving of a NWS special (unscheduled) product message on the weather server that is a part of the network (presently active from Tulsa on the OK-AR-MO partition of TexNet), where the I-field is the heading of the message. For the manually initiated version it is whatever the person types at the keyboard following the command. The UI prefixes the bell character and a c/r to that line when broadcasting it. Someone that wants to monitor these may set his Budlist to capture them on address ARES (note: that's ARES not APRS). The internal broadcast mechanism of TexNet is used to spread them throughout the network, and under some combinations of routing throughout a network containing loops they may be duplicated once or more times, although some of the loops have propagation filters to prevent certain directions of broadcasts. Since it is a connected network datagram within the network, it is not subject to being lost as a UI would be. It does not become a UI until it is sent off the individual local ports. It is not checking for a minimum of free memory, it sends it unless absolutely choked.

The severe weather watch/warning broadcasts on the OK/AR/MO portion of TexNet have been taking place for a little over a year now. I don't think anyone has yet made use of the manual input method. I got curious over the weekend and tested it real late one night, from AUSTIN, asking for anyone monitoring to leave me a message. Someone in LUBBOCK responded, and reported he happened to see both trials. Entirely no advance planning, all spontaneous.

I think that will meet most of the requirements of (4), but might need some tuning, and I am open to some comments. In particular I am interested in the from/to callsigns of the UI and do we need maybe one "WIDE" on the tail end, also should the bell char be moved to the end of the line or next line so as not to confuse APRS parsing, etc... It still needs to be compatible with the dumb-terminal user in an EOC monitoring for civil emergency type stuff. Do we need one format for ARES and another for APRS? Is it even applicable to APRS, requiring a connection and establishment of permissions (user has to respond from a code-table) ?

Item (1), just digipeating as a matter of routine, should come along with the process.

Items (2) and (3) appear feasible. There is a hopcounting process inherent in the broadcast routing process, and it should be feasible to preset a maximum hopcount that will cause the termination of these broadcasts. It probably wouldn't be effective until all of the nodes firmware were updated, but it would act in the interim to allow the propagation to continue to expand.

One comment I might need is to have some suggestion as to how to trigger the variable nature of the range. I presume it could be done with SSID's, and I assume that one will use a predetermined and unique address in a digi field to trigger it to begin with. Maybe a NWIDE-x or NFLOOD-x might be appropriate, where -x is an SSID representing a hop radius? Here NWIDE/NFLOOD represent network-wide, etc.
Again, I would need to have some sort of I-field checksum protection on duplicates, and minimum free memory acceptance checks. The radius ssid -x would probably take on valid values of -1 to maybe up to -3 or so, and -0 (default blank) would probably assume a radius of 1. Or maybe we could use the same trigger ID for all functions, and ssid -0 means no radius, just local repeat? Comments?

Here again, I ought to remind everyone of one basic constraint to which all the ideas are subject: little codespace. Still, I think it is worthwhile discussing, and I think something will come of it.

TPRS has an upcoming conference this fall in Austin, which we sponsor every year or so. It deals with technical issues on Packet and TexNet within TPRS, as opposed to beginners packet seminars, and I suspect that the APRS stuff might be a topic on the agenda. Tentative date I think is set for Nov 9. (That already conflicts with the local SET and the monthly foxhunt, but I think our options were limited).

268. Rock Bound GATE Radio

From: dkaszubski@why.net (dkaszubski)
Date: Mon, 09 Sep 1996 12:38:29 -0700
To: "aprssig@tapr.org" <aprssig@tapr.org>
Message-ID: <32347235.2E86@why.net>
Rendered body type: text/plain

After months being frustrated and seeing only 6 or 8 APRS stations on my map in the Dallas/Fort Worth area, I decided to put up an HF/VHF gateway at my home in Benbrook. WOW! What a difference. I now see 75 to 80 stations all over the country and beyond. Hopefully, everyone else in the area will see the same thing on 145.79Mhz and this may spawn more APRS activity.

BUT: This means dedicating an expensive HF radio to be locked on one frequency most of the time. Not my idea of fun. So, after scrounging around a bit, I came across an old Motorola rock bound hf rig that appears to be based on the Micor series. Unfortunately, since it was in commercial service, it only operates on USB, even though it has crystals for frequencies below 14 Mhz. After reading the DosAPRS docs, it appears this won't be a problem, just crystal it up for 10.1493Mhz USB and it should work fine with the KAM currently in service.

Questions:
1. Is this frequency a correct assumption?
2. Does anybody know any tricks to tuning up this rig?
3. Any experience with crystal companies for this setup? (I usually deal with Intenational Crystal out of Oklahoma)

Any comments or suggestions would be appreciated.

On this topic, is it fair to suggest that the APRS/WX/Skywarn capabilities be separated from the APRS/GPS group. Not so much on a different freq., but perhaps as a separate body?

After all, the APRS/WinAPRS/MacAPRS programs provide for a good tool for both interests, but there seems to be enuf diversity within the overall program to justify a separate WX/Skywarn group.

Just a thot.

Yes, I think using the SSID as a hop counter makes sense.  I have been
proposing the WIDE-N algorithm for almost 2 years now where -N is the op
counter up to 7 and then becomes a routing indicator 8 and above.  But I
have always maintained that the DIGI code should allow the user
specification of this CALLSIGN.  APRS would probably use "WIDE" as the
default, but you could also use TEXNET-N or any other netname and this
would be a callsign that TEXNET's would do what-ever with...

It depends on the audio tones of your KAM!  If it is an old KAM that uses
1600 and 1800 hz tones (1700 center) then subtract 2 * 1700 or 3400 HZ to
get the USB.  If it uses the new 2100 hz tones, then subtract 4200 Hz.

I have been trying to talk TEN-TEC into making a single freq HF radio just
ofr packet.  THey are interested if the demand is high.  CALL TEN TEC! and
ask to speak to their marketing manager...

Don't order those crystals just yet. 10.1493 Mhz is the "proper" freq for 30 m aprs alright, proper for the average of the mark and space (1600/1800 or is it 1800/1600 hz) tones. When using a KAM+, the radio is usually dialed to 10.1510 Mhz LSB, which then puts the average of the two tones on 10.1510 - 0.0017 = 10.1493 Mhz. I believe the KAM+ has the ability to interchange mark and space by issuing a command, thus it should be possible to put the radio on 10.1493 - 0.0017 = 10.1476 Mhz USB. If you want I can try this at home tonight and let you know if it works. Has anybody done this?

By the way, radios that are of recent enough age so as to not allow "out of band" TX, will give you a problem when pressed into 30 aprs service. This is because the radio dial says 10.151 which of course is 1Khz out of band, and it will not TX. A simple "MARS" modification can fix that.

I just posted aprs77a.zip and the upgrade files 77to77a and 76to77a.zip

These fix several of the recent problems, but it does not yet contain the code to support the WeatherMAX weather instrument. I got no feedback that anyone was using this WX station so I wanted to go ahead with 77a anyway.

Don't need to do that...(someone correct me if I get this wrong), but
information in HF and VHF packet is conveyed by transitions in the tones,
not in the tone itself. It doesn't matter if the radio is tuned to upper
or lower sideband.

>By the way, radios that are of recent enough age so as to not allow "out of

I've been using USB on my Kenwood 870 for just that reason, I haven't
seen the mod for it yet. My Yaseu FT-900, even before the mod, worked
from 10.000 - 10.500, so not all radios will have this problem.

Are you proposing a separate sig and/or mailing list? If so, I vote
no...I think the weather aspect of APRS is something that affects and
interests many, if not most, people on this sig. I belong to too many
mailing lists already, hi.

Very interesting! Could you please send me the model number of this radio ?
It may be a keeper for the hamfest list and browsing thru the back of trade
journals. I am in the trade and wound not mind doing some research on it and
see if I can find a source for these. I would guess that they are not too
popular on the used market so the price may be right if we can find a stash
of them sitting in some warehouse.

Rendered body type: text/plain

I agree that a seperate frequency may be a good idea for mature APRS areas
but two things must be thought of.

1) Non Mature areas may not have enough users to upport two systems. Some
may chose to be part of one group while others will chose another. There are
not enough of us out there yet to support two groups with enough interest to
keep 2 frequencies alive. I am not talking about just the SE but the whole
East Coast in general, with all the sig members sometimes we lose sight that
we are still a "small" number of amateurs. The sig makes APRS look like
there are thousands of users out there all over the country.

2) A Skywarn net does need a large coverage area. Reports from the local area are good but not good enough considering you want to have enough data to make this useful. Heck doppler radar gives us a lot of data as is, we need to offer the NWS more than just limited local reports to be useful. I do not know about you but frequencies are NOT a dime a dozen in this area and neither is money. To build another APRS network that has a viable range would require both of that. Not only is it expensive to get the equipment but difficult to find good sites, I am not talking about "Joe's 35ft Tower" I am speaking about 200+ feet. I think it would be a waste of money, users, and resources to split up.

Some day it may be necessary but in this area we have our hands full scraping up enough money for what we have and the users to make it worth while. I can't see any of us trying to do it all over again just to accomplish what we can already do. The frequencies are bad enough to boot, I do not want to add to the mess with more transmitters than are needed to get the job done.

Oh, NO! I don't know about anybody else who've chosen to be on Bill's "elmer" list, but I, for one, DON'T want that to be connected with the usenets! I just left AOL because of all the SPAM I was getting there. Imagine the volumes of garbage we'd receive given that kind of distribution.

Let's keep such access limited to those who've expressed interest in APRS (by following Bill's links) rather than being open to general consumption by the hordes. I'll be glad to assist ANYBODY who actually needs or wants it, but I DON'T want tons of SPAM, nor the riff-raff often associated with usenet. That's why, whenever the thread comes up here as to whether we should open the SIG up to that venue or leave it here it always gets voted down. 73

Nope!  Just letting the WX people run APRS to suit the WX/SKYWARN needs.
And the GPS people doing their thing.

I think we all can co-exist.

```
This is the fourth attempt to send this to the sig.  I get it at my other isp with
no problem but it does not show on the sig. appoloies if the other copies show
later.

>Now if we could just get the folks in Macon GA and South to put up digis
>(and in Macon's case: a real digi) we can begin to see I-75 coverage for 3-4
 ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
To Ralph and the SIG I have placed on the air a dedicated station that is
working reliably as a WIDE-RELAY digi.  WB4BDP and I are the only stations
that routinely run on a twenty four hour basis.

I have been unable to locate a site on a tower and am unable to afford
to buy my own.  If Ralph has any suggestions I would like to hear them.
About a year ago I e-mailed him but was not answered.

I would also like to know what he considers a "REAL DIGI".
Most likely about a grands worth of surplus commercial gear, hardline,
cavity filters, and access to a commercial site on a mountain top.

My definition of a "REAL DIGI" is one that is placed and maintained
on the air for the enjoyment of the ham community.  It should be open to
all who wish to use it.  It should be available on a reliable basis with
only minor down-time for maintenance.  It should be taken off the air or
worked into the system if a better option becomes available.

The MACON Wide-Relay digi has been in operation for over a year on a
```

continuous 24 hour a day basis. I am using a beam to reach the atlanta area; this precludes coverage to the south along I-75. I would like to improve this situation but can not do it alone. To date I have made several offers to various ham groups locally to hold training sessions. The last offer was to bring a computer to a pending SKYWARN Training session to demo APRS before or after the meeting. I was told that the timing would not work. If a site can be found I am willing to work with anyone to get a good permanent digi on the air. When this is accomplished I will be the first to set my station to conform to the new network.

>states down here. It would also be great to see the Savannah folks in the
>"rest" of the net.

I absolutely agree.

Ralph Fowler
rwf@mindspring.com

Ralph please do not consider this a flame. It is a response to your attack on my attempt to fill a need in the central georgia area. I find the situation as frustrating as you do. When I placed my station on the air it was with the hope that it might stimulate some interest.

I posted this to the SIG due to that venue being the first place complaints were aired. I have always attempted to use correct paths and to set the system to fit within the net. If I can improve this I will.

Unless comments are related to the aprssig please reply directly to:

<KC4ZGQ@IX.NETCOM.COM> OR <JKHAM@INTERNETMCI.COM> JOHN F. KRAUS II

283. APRS & APRS SKYWARN

From: Lorie and/or Al Zelna <ldajz@epix.net>
Date: Mon, 09 Sep 1996 21:06:26 +0000
To: aprssig@tapr.org
Message-ID: <323486D2.347B@epix.net>
Rendered body type: text/plain

I've begun reading the threads on this topic and am a bit concerned. It seems that general concensus is for seperate frequencies since SKYWARN is a "regional" problem. I think this is wrong.

Here in NE PA we are still in the infancy stage of APRS, but have a strong following of Hams who are active both in Packet and SKYWARN. We are also lucky to have licensed staff at our NWS office in Binghamton, NY. (ie: no need to worry about control op's) This just happens to be one our biggest future attractors for boosting APRS involvement. Instead of shunning those interested in "helping" a SKYWARN net from the rest of the "regional" action, why not utilize a TNC's dual-alias capability in a different way than originally professed. This is a spin-off of the WIDE-n idea.

For example: Let's say we have an NWS office station; N3XXX, two WIDEs that can hear the NWS; WA3ABC and WA3XYZ, and another WIDE that hears both of those WIDEs, but not the NWS; AA3ZZ. Of course, the best laid plans often fail, but if a SKYWARN-participating digi would use the aliases of WIDE and WX# this plan may work and limit overloading the frequency.

The NWS station would set an UNPROTO of APRS VIA WX1,WX2 etc. (NO WIDEs). If WA3ABC was set as WX1 and AA3ZZ was set as WX2, SKYWARN info could be passed to those areas interested without "disturbing" the WA3XYZ area. This chain could be extended to WX3 and WX4 if the owner of the digis allowed those aliases to be added/edited, as long as they were spaced and named properly. This would also work if another "chain was decided to go in a different direction. (ie: starting at WX1).

Coordination and cooperation is the key in every aspect of our chosen hobby. It is up to those involved and concerned with its well-being to take strides in accomodating change and improvement in it.

Flame if you must,

73 de N3KAE

It's a Motorola Model L70SGC1180BM, looks like a Micor mobile unit
stuffed into a big (6h x 18w x 24d) case with a power supply, speaker,
and all the usual front panel controls.  This one is a 12 channel with an
S/RF meter.  The whole thing weighs about 100 pounds and I have seen them
at hamfests for about a dollar a pound, albeit rarely.  This case would
probably fit any of the Micor trunk mount modules, the PA cooling fins
hang out the back.  I got this one from the recycle heap of the company I
work for so I gotta put it to Ham Radio Club use, not personal.  That
just means I'll move the GATE to our repeater site in Glen Rose one of
these days ;-)  The last time I had it turned on it put out about 150
```

```
watts, the built in time-out timer limited key down to 3 minutes but it
didn't even get warm after that much time.  This thing had "Remote
Location" written all over it!  I think the crystal elements are pretty
common, but if you find one with a couple elements already it it,
crystals are typically $15 - $20.   Any info would be appreciated!

I happen to agree. The more useful communications that we can get out on
APRS will not only boost our cause but show a need for the software. ARES
and RACES and SKYWARN are all welcome in North Carolina on 145.790 as long
as using APRS for nessecary communications only. No hour long rag chews.
Just the facts and the info that is important to the Storm, fire, flood, etc...

Be more tolerant. Digital hams want storm info too..

John don't let that bother you, i don't want to start a flame but take it with
a grain of salt. It's not any good unless it's controlled by Atlanta people i
guess. I don't have any problem with your digi showing here in North Alabama at
all, as far as i can see it works just great. Yes i agree there could be more
digi's but then again we have some pretty good once. Then we have one that's in
a perfect location that's realy messing things up here in North Alabama. The
one located on Mnt Cheaha is a great digi if it could only hear. It sends out a
great signal (I can hear it direct) but it can't receive worth a darn, if it
could that would be a great link from Alabama to Georgia. Anyway John hang in
there your doing ok in my book.

Jamie i agree but not all of it, What one person consideres nessecary, may
not be so to another. And hour long rag chews are very common here, and it
has been that way ever since there where only two of running APRS here in
North Alabama. I don't agree with the idea that we should curtail our use of
the way we have been using APRS in the past and present. This is exactly why
i am saying it would be a good idea to have a comitted frequency for those
very important functions like Skywarn, Races etc. You can't expect someone
300 or 400 miles away to clear the frequency because there's some bad
weather in a distant location (They didn't for us when 13 people got killed
in a tornado here). I just think it would make good sence to make a move
now.

Rendered body type: text/plain

First, Thanks for all the replies to the original message, both on the sig and private.

There are several very intersting idea out there that should be reviewed. Please allow me my replies:

Here is a quote from the March 1995 issue of QST, p. 114.

"This goal of this Special Interest Group (SIG) is to provide a forum for people interested in APRS so that they can ask questions, compare notes and exchange ideas. They'll discuss things pertaining to APRS, such as GPS, GPS units, applications of GPS and APRS (eg, automatic weather-reporting APRS used by hams who report the progress of hurricanes to the National Weather Service Hurricane Information Center in Miami), using APRS in public events like bike-athons, and in emergencies."

I have always concidered SKYWARN as an emergency service that we volunteer for. I've also always looked at APRS as a potential tool for use in SKYWARN. Let me let you in on another little secret while we're on this subject. According to the NWS in Little Rock, Doppler radar has an effective tornatic detection radius of only 80 miles! Case in point: the F5 tornado in Ft. Smith in which neither NWS office in Little Rock nor Tulsa were able to detect and warn those people. There was NO "offical" warning! However, there were several hams spotting WELL in advance! The doppler radar in Little Rock is also placed at a LOWER elevation that I am here and we have serval mountains in between us! They have admitted that the radar cannot "see" below 10,000 feet in this area. That is just the way it is. I'm sure there are other simular areas around the country and people are unaware of the exact coverage. Go visit your local NWS office and see if they are able to observe the weather down to the 2,000 foot level. I';m not trying to beat down the system, that is not the goal here. I just wanted you to know that we rely too much on the doppler radar and take it for granted that it "sees" all! Not so. But that is why we still have the SKYWARN Nets and spotters like us. Again, I forsee APRS as a vital tool in that.

Another reason I am bringing this to the forefront of the sig as well as looking for more ideas and suggestions, is that the fall storm season is forthcoming, not to mention the current peak of the hurricane season and all the spin-offs of those things once they make landfall. I'll be heading down to see the NWS after I get back from a a trip to NY state (APRS mobile trip fer sure!) and want to be armed to the hilt with all the answers to the questions that are going to arise. Imposible right!?

As to separate freqs for the "important functions like ARES, RACES and SKYWARN" well I both agree and disagree. There is no reason that all the

APRS stations must give or listen to a freq filled with SKYWARN (or other)
messages. But on the other hand, there is no reason, other that it hasn't
been implemented yet, that there can't be a shared freq that can handle
more than one "dedicated" network. I've seen and read the messages about
"TexNet" and "WX1, WX2...." and I think we're all hitting on the same
thing but need a forum to discuss this in detail. Any suggestions? (I vote
against another sig!) What happened to the APRS conference idea?

Again, thanks for all the sugestions and ideas! Keep them coming!

301. APRS Quake monitoring system

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 10 Sep 1996 10:48:37 -0400 (EDT)
To: aprssig@tapr.org
Cc: seismo@sas.org
Message-ID: <Pine.GSO.3.95.960910103909.8502A-100000@arctic>
Rendered body type: text/plain

KJ6BU advises an article in the Amateur Scientist column of May
1996 Scientific American discusses the growing interest in monitoring
RF at the 0.1 to 10 Hz range for detecting earthquakes (at about 4 Hz).
Just hook the output of a 2 foot long rod wound with 50,000 turns of
#30 magnet wire to your sound blaster card via a pre-amp and you
can collect this data. What is needed is a mechanism for distributing
this data. KJ6BU suggests APRS (the Automatic Position Reporting
System which is an amateur radio position reporting network all over
California... and elsewhere).

My reply is that the raw data at 20 samples per second with an
8 bit A/D would require almost 20 bytes per second which would
saturate an APRS net. If, however, you did a FFT of the raw data
and continuously averaged the background noise level, then you
could set a "threshold" that would only transmit data when an
event or signal exceeded that threshold, say by 5%. The last CA
earthquake reportedly produced a signal 300 times the background
level... Periodically, say once every 15 minutes, you would send one
packet showing your background noise level. A packet would consist
of just 40 bytes, each byte representing the magnitude of energy
detected in each 0.25 Hz bin of the FFT. APRS would plot these
reports on the map.

I think that The Sproul Bros and I would be happy to make some
kind of symbol so that would display these magnitudes on the map,
either as color (red being big!) or as vertical BAR graphs at each
location. If you used your mouse cursor to select any station, then
the full FFT data for that station would be displayed.

Also, it would be easy to adapt a MIM telemetry module to do all of
the A/D and FFT and data computation and packetizing. ALl you would need
to do is hook up the rod antenna and preamp to a MIM and a tiny

```
2 meter radio.  This way, you could put the whole thing out in the
woods (Away from 60 Hz and manmade interference!) and run it on
solar power!

    KJ6BU left me no EMAIL address  but his phone number is (805)
649-5412 in Ojai, CA 93023.  The Article referenced this web site:
http://www.thesphere.com/SAS.  There was a REPLY address on this
project as seismo@sas.org.

If anyone wants to take this ball and run with it, go for it!  We need a
consensus on the data rate.  If the filtered data can be reduced to
a background level of about 1 packet every 15 minuntes or so, and maybe
a peak of 10 times that during thunderstorms, then I dont think any APRS
net would mind a 100 times or higher data rate when a REAL earthquake was
detected.  Remember, this signal PRECEEDS the quake!

On Mon, 9 Sep 1996, Jon Brockmeier KB8SWB asked:

> Is there a way using APRS with a computer, TNC, radio, GPS, UltiiMeter
> weather equipment mount to a car, to report the position of the car and the
> true weather conditions

APRSdos REPLY/COMMENT: Not currently, but it could be done easily if there
was enough interest.  My approach would be the old push button manual
method.  APRS would talk to the TNC and GPS normally.  When you want to
make a WX report.  You push and hold a button for 3 seconds.

OOPS.  This would only work single port if you can make the WX sation and
the GPS talk at the same baud rate. (The TNC will work at any baud rate).

Otherwise, it will take a dual serial port laptop...

APRSdos REPLY/COMMENT:  You cant change it to LSB that simply.  Why
bother?  Just use USB and tune twice the value of your TNC tones lower.

```
My ticket also does NOT allow me to TX on 10.151 Mhz. And to some degree
your point is very valid, but not likely true.
```

The valid part is that I, like most other hams who have not really looked
at the TX signal with a spectrum analyzer, do not really know what the
spectral emissions are of my hf radio. Therefore setting a TX freq out of
the ham band is asking for trouble. On the other hand, the commercially
purchased radio (a Yaesu in my case) had to receive FCC type approval for
emissions. Therefore running SSB suppressed carrier with the dial set out
of band is probably OK in real life as long as one has control of the
modulation side bands and is confident of the radios frequency accuracy.
The same can be said of running less than a khz or two from the edge of the
band which MANY people do: One relies on the manufacturer to ensure that
the unwanted sideband suppression and carrier suppression on your radio are
as good or better as the radio that was submitted to the FCC for type
approval.

In any case there is another possible drawback to the 10.1476 Mhz USB radio
scenerio. That is that the receiver will be seeing more signals in the ham
band, depending on the filters that are available. The point is that the
packet signal is fairly narrow band, and many radios do not have the
flexibility to choose filters that will give you narrow bandwidth centered
1600 hz from the "carrier".

Ham radio is always fun!

At 05:27 PM 9/9/96 -0500, you wrote:

O yes Daniel there is a very good reason to have that type of service on it's
own frequency, you must not have read my message very well. There are very
good reasons not to share freq's with Skywarn, Ares, Races, etc. Already i
have seen messages saying that there's no reason for APRS users to be having
local keyboard sessions, that Skywarn is a more important service etc, etc. I
agree as much as any ham i sure would that Skywarn and all the other related
services are great for what they do, i myself am very involved in this service
and that's why i'm saying it will never work sharing the frequency with other
APRS users, not if you are planning on such a service to grow. Skywarn or
Races or Ares etc cannot expect those users that have been here to make APRS
grow to what it is today to get off or even co-exist with those services,

because i already see a trend for those groups to take over and use the
network that others have built up over time for just that service and kick off
the person (Later) that did all the hard work. Again i'm not flaming, let me
make this clear to those that are ready hands on the keyboard and waiting to
flame me. Just my opinion again!.

Now this is something that I think we in Central California could be
interested in! I am in Morro Bay some 80 miles from Ojai and WB6RIJ in
Santa Barbara some thirty miles. The "rod" antennas are constructed per
Scientific Amnerican. The big problem is no two meter path whatever.
Interesting idea tho! Cliff Buttschardt K7RR

Weather events are not local incidents. As an Emergency Manager, I WANT to know what's happening around me, because odds are the weather that is hammering my neighbors will probably effect me in the very near future. Case in point: winter cold fronts in Florida tend to be rather strong, triggering severe weather with frontal passage. If I see severe weather in the Tampa Bay area now, I can be fairly sure that in 3-5 hours, we will be getting the same thing. I can't rely on the next county west of me...it's in Texas, some 600 miles away! The closest radars are in Miami (100 miles east), Key West (100 miles south) and Ruskin (130 miles north).

In our business we try to educate people that hurricanes are not points on a map; they're huge weather generators that cover radii of hundreds of miles, areas of tens of thousands of square miles. Severe thunderstorms rarely are isolated events. They tend to travel in clusters, or along squall lines, with an impact on portions of, or entire states.

What is affecting Colorado now, will probably affect Missouri tomorrow, Ohio the day after and New England the following day. If you want a valid weather forecast for the weekend, look at what is happening 1000 miles west today.

SKYWARN use of APRS, like keyboard use, needs refinement. Minimal digi paths for crosstown keyboarding...longer paths and shorter QSO's for considerate use of the freq over longer distances...wide area, less frequent updates for severe weather, with expiration, so a short lived cluster of thunderstorms doesn't stay on the screen for two days after the event has ended...standards for tropical wx plots, that don't leave a storm sitting on a map in nine different locations over a week...

These are solvable "challenges." Frankly I'd rather see fresh updates where severe weather is 1000 miles away, than repeated spots of fixed stations that never move...but at least those fixed stations may move if the severe weather picks up the QTH and tosses it across town! I'd rather that wasn't my first clue that something was afoot!

> warning! However, there were several hams spotting WELL in advance!

As this issue has been hotly debated on the WX-TALK special interest
group on the iternet, I think it is important to clarify something you
said....The NWS DID ISSUE A TORNADO WARNING FOR FT. SMITH ARKANSAS 15
MINUTES IN ADVANCE OF THE STRIKE...HOWEVER, the EMA office in Ft. Smith
never received the warning because the same storm knocked out the
telephone line carrying that warning. Too bad they didn't have a NOAA
Weather Radio with alert feature.....and one further point: The exact
same amount of damage would have occurred in Ft. Smith, even if the
warning sirens had been sounded. Of course, some lives might have been
saved....that is hard to know.

To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.960910125101.5339A-100000@arctic>
Rendered body type: text/plain

The following files were posted in tapr/SIG/aprssig/files/upload

aprs77b.zip 1.05 meg
76to77b.zip 660k
77to77b.zip 250k

Ver 77b: 77a had a bug that caused incorrect selection of the default
response during a prompt. It was fixed and immediately re-relesed as 77b.
* New definitions of first POSIT character: (pending Sproul's agreement)
```
  / = TNC only     M = MacAPRS     X = Xaprs
  @ = APRSdos      W = WinAPRS     J = javAPRS
```

* JUST-TYPES command will display station TYPE (above) instead of symbol.
* Fixed WX fade-to-gray
* Fixed mouse to sleep problem
* Fixed ALT-BTEXT being forced to UCASE

Ver 77
* New MAPFIX27.EXE cleans up some minor old glitches!
* Fixed DAVIS bug with remote U-II's
* Contains new WX parsing scheme for Natl Huricane Center
* Can now set WX-METRIC for KPH and Celsius formats
* Consolidated Prompt code to one subroutine. Hopefully transparent
* alt-S-OTHER-REDRAW can now set period independent of BEACON rate
* Increased L/P lists to 6 pages by eliminating the cabability to
  accept long L-LIST lines (used to accept up to 120 chars with line wrap)
* Added SPCL-RUNNER symbol ([). Changed BBS/TCPIP to circles with B/I.
* RV'w now show up when you do a JUST-MOBILES on the map or P-LIST

Rendered body type: text/plain

This message is the periodic educational message we have to send out every few months to educate some HF operators how an SSB radio works. Unless your radio is broke or you are overdriving it badly, 10.151 LSB modulation with 1600/1800 HZ tones produces only two RF emissions at 10.151 (-) minus the tones. These are well within the band. The 40 dB width of these packets at 300 baud is less th 700 Hz. There is no carrier at 10.151. This is SSB, (suppressed carrier) remember.

If you want to prove this, tune in the guys at 10.151 LSB, and then ZEROBEAT their packets. Now read the dial. It should be 10.149.3. Dont be confused with the MARS stations operating at 10.153 LSB who occassionally have tones that zero beat at 10.151 or so...

Hi Gang,
I had two quick questions, if you can help, i appreciate it.

1. Everyone seems to be talking about version 7.7 or 7.7a, whenever I goto the tapr ftp site, they only have version 7.5c or something quite lower, is there a site where you can get the latest and greatest, I always thought TAPR, was the place to go, unless Im looking inthe wrong area.

2. I am looking for a radio to use in thecar for APRS, or maybe in the home for
packet, I am looking at the Alinco DR-150, for the fact, real mic jack, 3 power levels, and TOT, and another feature I think will do what I think is be able to monitor visually 6 other frequency to see if there is activity. This radio is ready for 9600 also, what I need though, is any complaints, recommendations, and the pin out of the microphone jack to KPC-3, so I can have a cable ready for
Peoria this year, first thing I plan to buy and get running in the car, also what type of power lead does it come with, is it the standard T-shape, \kinda spade type? I have existing Yaesu leads in the car think they might work.

Ok, what are they?

 Skywarn or
>Races or Ares etc cannot expect those users that have been here to make APRS
>grow to what it is today to get off or even co-exist with those services,
>because i already see a trend for those groups to take over and use the
>network that others have built up over time for just that service and kick off
>the person (Later) that did all the hard work.

The writer assumes that the system was set up for reasons other than Skywarn
or other emergency services.  In fact, in Northern IL, one of the reasons
that APRS took off so well was in late winter of 95 (I think) at a meeting
in the Rochelle EOC, Dupage Co/Multi-Co Severe Storm Warning System took a
serious look at APRS as an adjunct to its existing methods of warning,
having learned lessons from the Plainfield IL tornado in 90.

But what was initially a WX effort got diluted by the interest in GPS.

This is NOT to degrade GPS!  It all attracts APRS users.

And what applies to No IL doesn't necessarily apply to AL, or Chicago, for
that matter.

Message-ID: <32960910200223/0004818186NA3EM@MCIMAIL.COM>
Rendered body type: text/plain

Does anyone know if it is possible to have the TNC running at one speed say 4800 on one COM port and the Wx Station [Peet] on the other at 2400 bps.

At the time of sign on APRS asks for the speed of the TNC and I'm wondering if this speed is being set for both COM ports?

>....
```

I didn't read the article, but in case they didn't cover this, this will probably do nasty things to your computer if you have a nearby lightning strike, due to the lightning currents inducing currents in the coil.

Of course, you'd want to be somewhat concerned about sending false alarms. (i.e. "Local Ham operators predict earthquake. Film at 11.") (Assuming the press screws up and reports the RF monitoring as earthquake prediction.)

The other idea that occurred to me is to hook up some sort of actual very simple "shake detector". Something with an object that can fall over when shaken, triggering a switch closure, etc. The idea would be that if one station "shakes", ignore it, it's probably the cat. If 40 different APRS stations report "shakes" within a few minutes, something is probably happening and you'd know the area involved. (Or there's a widespread cat conspiracy in progress.)

You could also do something by having some sort of "heartbeat" system. Each APRS station (with or without a "shaker") would periodically transmit a "I'm OK" signal. You'd need to have APRS check and report that a station that transmitted before has stopped transmitting in some predefined time period. (e.g. Transmitted withing the last hour but not within the last 5 minutes.)

If a large percentage of the APRS stations in an area suddenly stop transmitting, you have something happening, like a change in propogation, a power outage, or something serious. This could be helpful in an emergency to tell you what areas are affected by earthquakes, power outages, floods, etc.

You could also have these "heartbeat" stations have some sort of human enterable status indication, e.g. "0-normal 1-noticable affects (I felt the ground shake) 2-mild effects (some damage, but I'm OK)... 6-I'm abandoning my position 7-send help, people are dieing... You'd probably want to keep the number of different status indicators small, but you could also allow a text message to be attached.

This would require that you have enough APRS stations around to make the data meaningful.

Hi all,

     This morning I looked at APRS and found Stu's WIDE-RELAY
(WA2JNF-4) station was apparently down.  I'm trying to get in
touch with him in case he's unaware of it.  In the meantime, I
have set my KPC-3 with an MYAlias of WIDE and MYNode of RELAY.
I expect this to be a temporary situation and my BText reflects
this.

     Unfortunately, I do not hear as well as Stu (my antenna is
on the roof at 80' HAAT, his is on a tower 200' HAAT!)  None-
theless, I'll see what I can do.  As of now, my digipath is:
W2HPM,WIDE,WIDE which will lead stuff more into the northeast
than towards the south.  Any suggestions on this would be ap-
preciated.  73

Well as usual when a storm hits or is about to hit the 6pm news interviews a
ham with radios in the background.
Tonight was not different with Hortense on it's way but what was different
is that the report was done at the National Hurricane Center in Mi ami. Nice
fancy Yaseu station decked out to the max, even a Yaseu clock! hi hi.
After all the chit chat as they were panning to the internet corner right
next to the ham station.. wait! what was that.. yes it is a APRS screen! A
momentary blast past what seemed to be 2 monitors with APRS on it! Sure was
a shame that no one spoke about it to the media, would have been a great
```

opportunity but I do not know if they were interested or not. It was only
1-2 seconds but to the "trained APRS eye" the screens did not seem to show
anything on the map! Oh well yesterday was the peak of the Hurricane season,
maybe we will get another opportunity soon.

We went through this at the Hurricane Center at Miami with their PK12.
There is a command, besides headerln, that needs to be set, and it deals
with TAPR style BBS messeges. The command is BBSMSGS, if I remember, and
it must be in the OFF state, I think. Also, remember to have MON set to
4 and nothing higher. The extra characters interfere with the APRS style
packets.

Before you get all excited about an automatic earthquake early
warning system you should read this quote from the article.

Quote:

"The idea that low-frequency electromagnetic waves could be precursors
to temblors remains controversial. Not all earthquakes release telltail
electromagnetic signals before striking., and many reasearchers consider
the data statistically unconvincing.

Amateur scientists might be able to contribute to this debate with the
easy-to-build detector described here. If the low-frequency electromagnetic
waves really do preceed earthquakes, this device will detect them."

End Quote

So, the theory behind AQRS (auotmatic quake reporting system) hasn't
even been proven yet although APRS could play a role in determing
it's validity.

Message-ID: <199609102316.SAA18677@tapr.org>
Rendered body type: text/plain

We are beginning to start the process of ordering the GPS-20 from Gramin.

As of today -- we have 75 of the 100 orders required. That leaves TAPR with
an additional 25 units to offer.

We plan on shipping shortly after the DCC, since the power connectors and
coax are due in the first of October.

If the Garmin units arrive before the DCC, we will plan on bringing a few
to the conference to sale and plan on shipping the coax and connectors after
the conf. For those that just can;t wait for their unit.

If you want to pickup your unit, minus the coax and power connector, be sure
to let Dorothy know before hand so we can plan on having your unit
there...this is all based on Garmin getting us the units before we leave for
the conference. We will then ship the coax and power connector to you after
the conference when they arrive.

Cheers - Greg

Seymour,

The TNC baud rate is just that - only the tnc. Your Peet Wx station spits out data a 2400 baud - it's not adjustable by the user. Unless you run your tnc at 2400 baud (to the computer) the two com ports are always set for different baud rates.

That's what I'm going to do. Been operating with another rig on 10.1476
USB for a while and it works fine.
Thanks for the help!

326. TNC digi methods Was: Update APRS L3 (TexNet)

From: TonyDrumm@ibm.net (Tony Drumm)
Date: Tue, 10 Sep 1996 21:19:15 -0500
To: aprssig@tapr.org
Message-ID: <199609110212.CAA220580@smtp-gw01.ny.us.ibm.net>
Rendered body type: text/plain

>Yes, I think using the SSID as a hop counter makes sense. I have been
snipped

Along similar lines...

Last night we had a big band opening in the upper midwest. I noticed lots of DX on my mobile voice radio, so when I got home, I started up the station computer. I've been running my WX station using the TNC w/o computer via the GPS mode. Wow! Lots of stations from IA, WI, IL, MO heard here in southeast MN. Many I would hear on the first digi. Some I heard direct. BTW, I think APRS lies sometimes on the DIGI page - it often shows gated stations as heard direct (asterisk by the station name) that I know can't be. And, I saw some of the initial packets for a few stations that I did not hear direct but they also got the asterisk. Not consistent, though.

Anyway, when we have an opening, and even occassionally when we just have above average propagation, what I wish I knew was the real id of the WIDE that I'm hearing. It would be useful if the digipeater, when resending something through its alias ID, could replace that alias with its true ID. This would help those trying to figure out how a packet got here and would also make it easy for a TNC to avoid resending a packet it has already digipeated. I don't know how feasible this would be - any CRC info would have to be regenerated. But it would be nice...

Is this new WX format compatable with AutoWX???? There is an AutoWX user near me reporting "strange readings".... haven't been over to see just what he means as yet.

329. Baja, Mex, & CentAm maps

From: KSwaggart@aol.com
Date: Tue, 10 Sep 1996 23:22:49 -0400
To: aprssig@tapr.org
Message-ID: <960910232248_305682268@emout06.mail.aol.com>
Rendered body type: text/plain

I've uploaded BajaMaps.zip and .txt to
tapr.org:/tapr/SIG/aprssig/files/upload

This file contains Maplist.MX and maps from San Diego to the Panama Canal, most at the 256 mile scale. They were created to support Rick, KN6KB, on his upcoming trip from San Francisco to Miami via the canal, and any other APRS /MM operations in that area.

Countries covered include: Mexico (Pacific coast), Honduras, El Salvador, Nicaragua, Costa Rica, Belize, and Panama.

These maps were created from 1:2,000,000 scale aeronautical Jet Navigation Charts (JNC), and concentrate primarily on the Pacific coastal areas. Some Caribbean coverage from the canal up to the Yucatan is also included. The JNCs are Lambert Conformal type projections, so some errors will exist but I've have tried to minimize them.

Using pkunzip -dn will put the new MAPLIST.MX and the maps in their proper directories.

What are the consequences if any of ignoring the "Com buffer overflow error" that occasionally pop up from time to time. I have had these error occur with a 386laptop, a compaq 386, a packard bell 486, an Acer pentium computer. More often on the 386's but they have occurred on the pentium also.. What happen if I choose to simply ignore the error message??

Thanks in advance..

One draw back is you lose data! In a Windows 3.1xx versions where DOS is
active, you can
increase the com buffers.... try that- if you still having trouble slow the
port down, i.e., go from say 9600 baud to 4800, etc.

This may help or may not-

Also consider upgrading you I/O board to include a better UART chip...

Tony Drumm[SMTP:TonyDrumm@ibm.net] said, among other things:

>what I wish I knew was the real id of the WIDE
>that I'm hearing. It would be useful if the digipeater, when resending
>something through its alias ID, could replace that alias with its true ID.
>This would help those trying to figure out how a packet got here and would
>also make it easy for a TNC to avoid resending a packet it has already
>digipeated.

That is exactly what we did in our Intelligent Border Markers for the
Bosnian forces (see our web page). We've dubbed it 'Digipeat Callsign
Substitution.' When a packet modem repeats a frame which was addressed to
one of its alias callsigns, it substitutes its MYCALL for the alias
callsign in the outgoing frame header.

Our purpose was to allow a generic digipeat when we don't know the actual
callsigns of the surrounding units, but once a frame actually gets to the
end station, an exact return path is known. Once a reply is sent to the
originating unit, it also knows an exact path to the end station and if
that path is saved, there is no longer a need to use generic addressing.

I've been talking with Bob (APR) about this for some time and he is pushing
us to release this in our amateur code. We will, but can't say how soon.
We're kinda overloaded with industrial coding work right now, so this has
to wait for the next break in the workload.

I saw somthing very simular back in March (I tink) on the Discovery
Channel. There was a program about storm spotters that ran around in this
exeptionally well laid out van. In it were multiple radio sets and 2 APRS
screens. It was nice to see that as I was over at a freinds place showing
off the mobile APRS at that time. It I'm not mistaken they indicated that
it was the first time it had been used in the field but wasn't in the NWS
office as yet. At any rate it was nice to see it on Discovery and to see
the reaction of my friend. (He now has his ticket!)

True, Roger, but only three people even acknowledged that I was in the Chicago area over Labor Day weekend! I was really disappointed particularly when one guy said they were all at a meeting in Streamwood (where I was passing through at the time!) and didn't even invite me to the meeting or respond when I asked where it was!!!

Maybe I'm wrong here, BUT I would expect that a visiting APRS mobile ought to have been made feel more welcome. In Kansas City we attempt to contact anyone passing through and at least someone says "hey, stop in if you've got time!"

Granted the Chicago area DOES have a lot of users but my initial impression is that they aren't interested in socializing with visitors. I hope I'm wrong because I've met a LOT of wonderful people in Chicago in my may trips there over the past 10 years. I have found that face-to-face Chicagoland people are genuinely nice and eager to make us "furriners" welcome and feel at home! Maybe I expected too much from the amateur community???

Don't take this personal, Chicago folks, I guess I was just really disappointed because Karla and I had planned on taking time to visit and

meet you during our vacation...I hope that it works out better in December
when I come to Midwest Band and Orchestra Clinic right before Christmas!

I would hope that everyone would submit a proposed agenda item, forum
suggestion, etc. so the planners could invite speakers to present, secure
the proper venue and take it from there...Apparently there seems to be
enough interest to look into the possibility further, so I'll refer that on
to our Board of Directors and we'll take a look at the possibilities. Only
concern here is that our treasury, at this point, is quite small and I could
foresee having an advance registration to cover the venue costs or, perhaps,
another APRS group would consider pooling resources with us? (Are you
listening NIAN?)

Anyway, that's about enough on this thread. We'll take the ball and toss
it, see where it lands and get back to the SIG later....

Hello Don,

I've seen that on every program for the last 2 yrs and I just ignore it
also.
If you want when you first fire up the program
Hold down " ALT " and hit  " S " " T "  that will restart the ini * .TNC
file again.

Have fun
73
Roger  n8chb

PS:  have seen this on several computers like you, could be my TNC
needing more time to read?

349. Advanced Surveillance Technologies Conference II

From: Claude 995-5040 pager 4541 <CHEAD@exame2.dseg.ti.com>
Date: Wed, 11 Sep 1996 9:37:11 -0500 (CDT)

Message-ID: <960911093711.204264f1@exame2.dseg.ti.com>
Rendered body type: text/plain

The following is a excerpt from a message forwarded from Jim Warren's
GovAccess SIG. The conference mentioned deals with the broad subject of
individual privacy vs government surveillance by a distressingly large group

of techniques. I have put the program header and one topic from the program
dealing with vehicle location. Shades of APRS! I have the complete text of
the conference program message and will be happy to forward it privately to
anyone who asks. The whole thing is a little long for the APRSSIG and most
of it is not directly related.

352. APRS & WX & GPS & freqs

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 11 Sep 1996 11:06:25 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.960911103101.25098J-100000@arctic>
Rendered body type: text/plain

```
Please conisder ignoring fools and stupidity on this SIG and don't feel
compelled to show how right you are and how wrong someone else is with
your brilliant diatribe. I dont have time to read this stuff.   Just hit
delete!      Now... my turn, hi hi :-).

All I said was, that serious WX users should *consider* getting a UHF freq
coordinated for APRS WX.  Why does everyone have to then demand that
everyone else do it their way?

1) Having 145.79 as a common freq is ideal if you can get it.  Both
   WX and GPS can share it.  WHy argue that point!  SOme areas are
   more interested in WX, some more in GPS.  That's their choice!

2) If you think APRS is NOT growing, and that a single 1200 baud channel
is sufficient then FINE!  Dont try to force your views on someone else!

3)  If you think APRS is going to grow both in WX and GPS and Earthquakes
and ARES and RACES and telemetry and you want to have some control over
your piece of that network, then simple self preservation should tell YOU
to start doing something NOW.  It aint easy to get a freq.  You will never
pull off the coup that was used in some areas to get 145.79 again...

Thinking that you are going to be able to demand that your network do only
what you want is not going to work in the long run.
```

Everything should be considered. New freqs, new bands, 9600, backbones, new routing schemes, crosslinks, gateways... etc. Yes, we absolutely need to see distant WX. But the routing path is FIXED! DOesnt that suggest that operating on what ever freq you can GET is solvable?

Just do something, ORGANIZE, *THINK*, make decisions based on your areas needs. Take advantage of the differences in applications, dont try to force every application to one solution.

SOAP OFF.. hi hi

APRSdos REPLY/COMMENT: Agreed 100%, but if a tree falls in the woods and no one is listening, does it make noise?   Maybe there weren't enough sensors in the right places...

I am a skeptic about most pseudo science, but the realization that a BIC lighter can generate a 10,000 volt spike by simply striking a piece of quartz and that quartz is rock, gives me the gut feel that the bazillions of PSI building up in rock prior to a quake could quite easily generate electromagnetic signals. Anyway, a good sicence project, hi hi

Your comments make me realize that there is a core difference here.
The ELF stuff is possibly predictive, but somewhat speculative. i.e.
"We've got ELF, but does that mean we're going to have an earthquake?"
Of course, if enough ELF detectors are spread around we might prove or
disprove the ELF-earthquake connection.

The heartbeat system would be an after-the-fact assessment tool. It
would tell you what areas had been affected by the event one or two
"heartbeat" cycles later.

The shaker or manual status entry could be nearly real time. I would
expect a "shaker" alarm to be sent out nearly immediately after triggered.

I've been attending hamfests and conferences (as a manufacturer) for 11
years and have yet to see any issues resolved at such locations. They are
great for meeting people, conjuring up neat new ideas, eating and drinking,
etc. but not good for planning or resolving... In other words, things get
started there, but they don't get finished there. Nearly every idea that
comes up which is worth pursuing is set aside with an 'we ought to continue
this via e-mail after we get home and work out the details.'

This forum (with appropriate private messages) is probably the most
effective coordination medium.

My inpression of the National APRS Conference discussion so far is that it
is a local to regional event with national in its name .... I'm still
watching to see what develops, but I'm pretty tired of travel. Almost
didn't go to the TAPR/ARRL DCC this year, and that is an established
national event.

361. APRS for MFJ 1278

From: Gordo42@aol.com
Date: Wed, 11 Sep 1996 14:32:44 -0400
To: aprssig@tapr.org
Message-ID: <960911143244_199281856@emout12.mail.aol.com>
Rendered body type: text/plain

I was wondering if you had a program that would work on the MFJ 1278 or the
MFJ 1270.

The MFJ 1278 is set for 7 bit and all of the APRS programs I have found so
far will not work due to the fact that they are written for 8 bit.

Due you know where I can find a copy that will run on the MFJ 1278.

I am presently using APRS66 on a borrowed Kantronics TNC.

Any help would be appreciated.

Thank you,
AA8GV

Please disregard my last message, your looking for KO4HD's e-mail. I
missed the call, duh!

PS-javAPRS is now at our web site, I did it between the hour of 1 and
2am. It was easy for me since all I had to do was copy and paste.

Rendered body type: text/plain

```
I noticed two 'bugs' in 7.7b.

1) File->DOS gave me an 'illegal function call' error.  APRS aborted.

2) The version on the logo screen says 7.7a.  I ftped aprs77b.zip
from tapr on Tuesday.

You're missing the point here, Bill.  It's not about sharing resources, it's
about getting along and recognizing that there ARE, indeed, times when one
service should yield to the other.  Separate networks are ONLY needed where
the users
refuse to get along.

In DOS APRS there is ALWAYS the SPCL net.  Everyone sees you but SPCL group
doesn't see anything else except stuff sent to SPCL.  Then there is the
closed network feature.  There is absolutely no reason why there should be
separate frequencies!

I can, however, see that in a MATURE SKYWARN network where a full-blown
system of remote WX sites, spotters, trackers, NWS office and so forth are
using APRS for Full-Time WX work that there couldbe the need for an
alternate frequency.

Again, the bottom line is COOPERATION.  Keyboarding should cease during any
emergency situation (on APRS or ANY other network).  That's in the rules,
isn't it?
Intentionally impeding emergency communications by failure to yield to
emergency traffic is malicious interference, pure and simple.

Folks has just gotta larn to work together!

And it's about to do the same thing again in Kansas City!  (you know
"everything's up to date in Kansas City")  Our NWS station will be on the
air sometime very soon when NWS finishes installing its new computer
network.  Space is already allocated and awaits our equipment!  Next thing
we'll see are storm-spotters with stand-alone trackers or MIM modules to
report their exact position back to NWS along with verbal reports!

Exciting time to be in amateur radio and packet, isn't it guys!

(Nice to see you on the SIG, Bill!  I passed through QC Labor Day Monday and
didn't see a soul live on 145.79....Had hoped to at least say a quick HI to
you all)

Thanks Tom for the quick reply, I will try your suggestions, The only one that I am sure that I can do tho is decrease the com port baud rate.. I currently am running APRS in the Windows 95 background on an ACER Pentium computer. It has the 16550 uart chips I believe.

Anyways, Thanks again for the suggestions.
Don

Since someone here usually posts certain messages from here over to the
coordinator's mailing list, I thought I'd let you see this message from that
list.  The Author is the fone of the original Directors and Incorporators of
the National Frequency Coordinator's Council, who is acting as the new SPOC
(Single Point of Contact) organization.

 Someone may need to explain to him that most APRS users are cognizant of
the proximity and take measures to avoid interference.  Hopefully the
satellite does the same  ;-) <wink>.

From: WhitBrown@aol.com

Whit quoted Werner:

In a message dated 96-09-10 08:07:20 EDT, WERNER.W.F-@smtpgty.bwi.wec.com
(WERNER.W.F-) writes:

>
>Hey guys, TMARC/DMARC are beginning negotiations about bandplanning -
>trying to make sense of the voice/digital thing.  Would like your comments
>on the following:
>
>1.) 2 meters, how about digital in 144.3 to 144.5?  Repeater directory
>shows as satellite but our satellite folks disavow any knowledge of its use
>for this purpose. Rumor has it that other areas have designated this for
>packet/simplex.
>
```

```
Then Whit said:

  Bill, My satellite sources says there is indeed satellite activity on
144.3-144.5, much of is it nonpublished command frequencies, and is so
alloted by most countries. I hope this doesn't turn into another
inconsiderate digital excursion into satellite uses like the APRS moving into
145.79...right up against 'em.

No i don't think i'm missing the point Jim, you stated it yourself above that
keyboarding and all other activity is to stop!. This is why i suggested another
frequency would be better instead of expecting everyone to stop all their activity
because those folk need the frequncy. Would it not be better to aquire a frequency
of it's own where everyone would now not to go there unless there's a reason to
participate. I can understand why they want to, all the hard work of getting a good
network setup is already there and done by others. And i doesn't have anything to
do with getting along with each other. I'm just bringing up some points that would
i'm sure bother more then a few APRS users. And Jim i have FCC part 97 in the shack
here like i'm suppose to have thank you Hi. I had no intention for this to be a
flame, but i'm sure many will take it as such. Like i stated before i had to fight
hard to get this frequency coordinated (By the way i maybe very well the only one
in Alabama that does have a coordinated Digi frequency) to be very concerned about
how it's going to be used and why. I look at it no different then would any other
coordinated packet Digi. But then again if the majority of the users in this area
would agree with using it for Skywarn or whatever would be fine with me, but that
doesn't mean that would be the best thing to do.I'm still convinced that a Skywarn
```

```
APRS frequency would serve the community much better then trying to use an existing
network with already many users on it.

Message-ID: <19960911.211848.4639.2.lpchvn@juno.com>
Rendered body type: text/plain

```
Hi Bob, -Just a note to let you know that I received the APRS SOFTWARE
disk, but I have a problem,I cannot unzip the files,
I printed the INSTALL.TXT  file, and the instructions says, to use a
recent version (1993) of PKUNZIP.EXE, and says that the file,
PKUNZIP.EXE, is omitted on some disks to make room,
I have searched my files, but I do not have that recent version of
PKUNZIP.EXE
any help where I could get that version would be very much appreciated,
                                                      Thanks, Paul ,
KA1QP

381. Re: [APRSSIG:4627] APRS & WX & GPS NETWORK.

From: etjm@ECUA.NET.ec (Ing Teodoro Jaramillo M.)
Date: Wed, 11 Sep 1996 21:50:19 -0500
To: aprssig@tapr.org
Message-ID: <9609120243.AA69152@ecua.net.ec>
Rendered body type: text/plain

```
Hello BOB and readers of APRSSIG
I am a good reader, listener and GOOD STUDENT of digital technologies, and
try to apply them accordingly to the local enviroment
which is "totally VIRGIN LAND" for development.. therefore being the only
sysop in Ecuador and work and practive all possible modes on most bands..
I have been learning for a long time now APRS and all i can do is applaude
loudly to Mr. Bob Bruninga for his works and now his patience .

my request is simple and therefore it will turn inmediately complex:
 I have been requested by the National Civil Defense to design a digital
network ( ecuador is  smaller  than  NEVADA JUST IN CASE) WHICH WILL
CARRY FOR  20 PROVINCES  A NETWORK OF :  SHORT DATA PACKET TYPE, GPS
FIXED,REMOTE, RESCUE,MOBIL, AIR, MARINE, PORTABLE IF NEEDED AND  MOST
IMPORTANT IS THE  NETWORKING OF   WEATHER INFORMATION FROM AND TO ALL
THE PLACES IN THE PROVINCES (20)  GALAPAGOS WILL BE ON HC8   ON H.F.

QUESTIONS:
 1. HOW ADAPTABLE IS THE WEATHER PACKET DATA TO TRAVEL THRU A
FAIR NUMBER OF  DIGITAL REPEATERS ( TO COVER ECUADOR ABOUT 8-10 )

2. THE  RAW  WX DATA SHOULD BE  CAPTURED AND EVALUATED STORED ANALYZED
    ETC IN AT LEAST  4-6  CENTERS  AROUND THE COUNTRY MOSTLY IN THE
     BIG CITIES.

3. LIKEWISE WITH   G.P.S  GATHERED ,CAPTURED  INFORMATION.

4. IT IS POSSIBLE TO ENCLOSE SHORT  PACKET DATA COMMENTS EITHER ON WX AND
    OR  GPS THRU THIS SORT OF  NETWORK...???.

5. WHICH TYPE, BRAND, PROTOCOL, ACCESORIES, FOR  WEATHER AND  ALSO FOR
    G.P.S. WITH  TNC'S ARE THE MOST RELIABLE I HAVE READ OF MANY TYPES
   BRANDS FOR   WEATHER NOT MANY BUT FOR  GPS SEVERAL TNC'SMODEM COMBI
   NATIONS( I AM USING A  PACCOM TINY2-MK2-GPS WITH  KAM+, KPC-3 AND
    SHORTLY  WITH  KANTRONICS  9612.

6.  CAN  HIGHER SPEEDS THAN 1200 BAUD BE ACCOMODATED IN A NETWORK FOR
    THE SAKE OF RELIABILY,SPEED,TIME AND OR IS IT BETTER TO STAY FOR
     RELIABLE KNOWN SPEED 1200 BAUD ON  VHF AND ALSO PERHAPS PRICE AND
     AVAILABILITY OF PARTS FOR  SYSTEM CONFIGURATION. PSE ADVISE.

7.  SITES WE HAVE ALL THE WAY FROM 16000 FT(THAT IS RIGHT) LOOKING AT
     NEARLY 350-400 KILOMETERS COVERAGE OVER THE COAST-LINE FLAT LANDS
    FROM THE ANDES AND FROM SAME SITES PERFECT  DIGI-LINKING OR GOING
     TO DUAL PORTS AND HIGHER SPEEDS IF NEEDED.

8.    MOST OF THE WEATHER INSTRUMENTS WILL BE AT OR NEAR THE  AIRPORTS
      WHERE THERE  IS QUALIFIED PERSONNEL, SAFETY AND INSTALLATIONS ALL
       READY AVAAILABLE, OTHERS IN BUILDINGS AND REMOTE AREAS AS  WELL.
```

9 FREQUENCIESWELL THERE IS NOT MUCH OF A FIGHT... HERE AT ALL AND THERE IS A FEW VOICE REPEATERS SCATERRED IN THE 145- UP TO 148 MHZ. UHF IS CLEAR 43-450 MHZ.

10. LAST QUESTIONS BEFORE MAKING THIS UNREADABLE AND TIRING TO BOB AND OTHERS.... SUGGSTIONS ON EQUIPMENT SINCE MOST OF IT OR ALL OF IT WILL BE NEW... COULD ATTEMPT TO ACQUIRE GOOD FILTERED, REALIABLE, POWER FULL RADIOS (DATA-READY) WHICH COULD BE USED FOR VOICE AND WX-GPS PERHAPS NORMAL PACKET WHENEVER THIS RADIOS-SITES ARE NEAAR OPERATORS AND COULD ALSO CHANGE FRECUENCIES AND DO ""REAL FAST PACKET DATA FOR THE NATIONAL CIVIL DEFENSE ORGANIZATION" INPARALELL WITH THE WX=-GPS AND SHORT DATA COMMENTS...

I CERTAINLY BOB APPRECIATTE YOUR INITIAL COMMENTS, PARTIAL, INITIAL AND IF NEEDED WE SHALL DISCUSS THIS THRU OTHER MEANS, FAX AND OR DIRECT E-MAIL... BUT I AM SURE THAT THE EXPERIENCE FROM MANY APRS=GPS WX THAT I SEE SO ACTIVE IN THE 10.151 WHICH I MONITOR THEIR COMMENTS CERTAINLY WILL BE MORE THAN WELCOME TO BUILD THE BASIS OF THE DESIGN FOR THIS EXITING PROJECT WHICHIS FEASIBLE REGARDING, BUDGET, SITES, ACCESS, POWER, TOWERS, ETC WHICH MAKE IT POSSIBLE TO IMPLEMENT. MY EXPERIENCE IS VERY FAIR IN DIGITAL WORK AND HAVE SEST UP SOME PACKET NETWORKS HERE AND THIS TIME WILL BE BIGGER AND BETTER AND OF A BETTER USEAGE FOR LOCAL, REGIONAL, NATIONAL AMATEUR SUPPORT FOR ALL PARTIES.

PUT ME IN TOUCH WITH MANUFACTURERS AND I SHALL ADDRESS THEM THE PROPER QUESTIONS IN THEIR AREA.. BUT GUIDANCE IS SURELY NEEDED TO CONPREHEND THAT IS POSIBLE TO...... HAVE FLOW OF WEATHER PERIODIC DATA- RATES AND ALSO GPS FLOW AS WELL AS SHORT LINES OF COMMENTS(SUCH AS BEACONS,AND SHORT LOCAL AND OR LONGER DISTANCE QSO'S EXCHANGE OF KEYBOARD TO KEYBOARD.

WATCHING ONLY 10.151 FROM 2200Z THRU 1300Z WITH GOOD ANTENNAS ,RADIO TNC AND LOCATION I ACQUIRE IN A NORMAL EVENING NOT LESS THAN 20-30 SITES, WEATHER, MOBILES(W7LUS) OTHERS, YATCHS AND ALOT OF DIGI-STATIONS RELAY TYPES. PROPAGATION MOSLTY PAINTS FOR MY LOCATION....FROM PANANA TO NORTHERN CANADA THRU THE EASTERN SEA-BOARD AND MOSTLY INTO TEXAS OKLA, WI,OTHERS,,VERY FEW CALIFORNIANS MAKE I SEE BILL WB6LPG SOEM OREGON (KEN) . NEED TO LEARN MORE ON THE GOOD USE OF APRS AND TRICKS... SUCH AS ""SPCL""" ETC.

I READ ALL OF YOUR MESSAGES GUYS AND USUALLY GET A DUMP OF NOT LESS THAN 40-50 A DAY....WILL STAY AS LONG AS I CAN ON THE APRSSIG BUT HONESTLY AT TIME....IT IS DISCOURAGING....COMING FROM AN INTERNATIONAL READER....MOSST GUYS CAN GET TURN ON ANDON ON NOTHING.... AND SUDDENDLY BEING OF NOT IMPORTANCE "" GOES AWAY" BUT ALSO ALOT OF INTERSTING SUBJECTS AND MOSTLY ADMIRE YOUR PATIENCE ""BOB BRUNINGA" WHAT A PROGRAM, WHAT A JOB AND OF COURSE OTHERS HELP IDENTIFY PROBLEMS AND FIND CURES... A GREAT SYSTEM AL IN ALL AND GLAD TO BE INTO APRS-GPS-AND SOON HOPE "WX".

We are having a hamfest this weekend in Newtown, CT, and I want to run an
APRS demo to try to generate some interest in this area.  Who knows,
maybe we can get enough for a club order :-)

Problem is that the site is in an RF hole, and I have doubts about being
able to run any live demos.  I was thinking that a replay of one of the
recent hurricanes would be a neat demo.  Does anybody have the tracking
files that I could FTP?  Hortense would probably be ideal, since it is so
topical right now, but Fran is probably still fresh in everybody's
memory, too.

I am trying to keep up with the list, but I am travelling this week, so a
copy by private e-mail would be appreciated, if possible.

Thanks in advance and

>lpchvn@juno.com

Hi, Paul....

Sorry to butt in here, but I may be able to help you is a small way. If you
have QBASIC in your copy of DOS, I can send you a message wich will contain
an ASCII file of a QBASIC program that will create a different program
called UUDECODE.UUE  Since you use juno, you probabably will not be able to
get any binary file forwarded to you, even as an attachment. I will send you
a copy of a simple UUDECODE program writtem for QBASIC, if you wish, that
you may compile using your copy of QBASIC and get a binary file called
UUDECODE.COM. Once you have that saved on your computer (it is a pc clone,
isn't it?) I can send you text files of PKUNZIP that are in UUENCODEed
format. Won't cause juno to burp. Just run the UUDECODE program on these
files (they are about 12k bytes in 4 files) keeping them in sequence and
copying them into one large file. Edit the file to remove everything between
the files and leave the "start" or begin line and the end line. The spaces
in between the file sections has to be cleaned out. If you use the DOS EDIT
program, use Control-Y to delete the whole line. Be careful not to remove
any line starting with a uppercase M !!! Then save it. Run UUDECODE, setting
this big file as the input and call the output file PKUNZIP.EXE. You should
end up with a copy of PKUNZIP.EXE, 29,378 bytes long dated 2-1-93. When you
```

use it to install APRS, you MUST you the -d option!!!

If you know the maximum size of a message that you are allowed to receive,
let me know and I'll split them up so that they do not exceed that limit.

What an offer! Just can't refuse, huh? <grin> I'll start if you ask me to
send it. I don't want you to think I was forcing this on you. If you are on
juno, it will come in handy, one day! Take care... (you'll love APRS)

We had the same problem at the Atlanta Hamfest 2 yrs ago. Since there was
activity in the area, (but no local digi yet) we set up a temporary WIDE in
a car in the parking lot. It brought all the APRS signals from the 40 mile
away digi into the convention center and we had a convincing full live demo
in the PacComm booth.

So convincing that 46 folks registered APRS as a result of it. We handed
out 50-60 sets of disks.

Ralph

I'm planning a trip from Marshall AR to Rochester NY. Leaving this
Saturday, I'll be traveling APRS mobile to I-44 in MO to I-70 in IL, IN

```
and OH. Turning north in OH on I-71 to I-90 on to Rochester. I have to be
there on Tuesday. On the way back however, I am taking I-90 across to
South Bend, IN. From South Bend, I am game to any direction that is
sort-of southwest to Arkansas.

During my trip I'd like to meet with anyone interested in the APRS Skywarn
project. I'd also like to make a few stops and just visit with anyone that
is an APRS user. As you might guess, I'm not in any hurry to get there or
return! (of course around here no one gets in a hurry anyway!)

Hope to meet you out there!

APRSdos ANSWER:      NUMBER 4!  I've been doing it for free, but
each of these distractions add up and it keeps me from doing what I want
to do... and need to be doing.  Also a legal buddy  said that my kids need
to be actively involved to be considered partners in APRS.  So I'm
going to let them do this part of the paperwork and charge $7.   I
dont like doing it on the internet, because I'm still using a 1980's mail
program and have to manually make notes, compute #s off line and then
re-log on to reply with new #'s...  US mail only please...

392. Re: [APRSSIG:4650] Re: SKYWARN PART 2

From: ku0g@sprynet.com (Jim Duncan)
Date: Thu, 12 Sep 1996 11:10:39 -0700
To: aprssig@tapr.org
Message-ID: <199609121810.LAA20649@m1.sprynet.com>
Rendered body type: text/plain

Wild Bill Nolle spluttered thus:
>No i don't think i'm missing the point Jim, you stated it yourself above that
>keyboarding and all other activity is to stop!. This is why i suggested
another
>frequency would be better instead of expecting everyone to stop all their
activity
>because those folk need the frequncy. Would it not be better to aquire a
frequency
>of it's own where everyone would now not to go there unless there's a
reason to
>participate. I can understand why they want to, all the hard work of
getting a good
>network setup is already there and done by others.

BUT WHY RE-INVENT THE WHEEL? (Caps used to emphasize my responses, I'm not yelling...) APRS is FIRST AND FOREMOST a public-service communications tool: a practical use for packet radio above and beyond just rag-chew keyboarding. I enjoy a good rag-chew as much as the next guy but I also have enough common sense and operating courtesy that I am going to cease my rag-chew during a time when emergency communications are taking place. From my point of view as network coordinator for this area of Missouri and Kansas I have to respect the rights of those networks neighboring mine. This means that I need to COOPERATE with them and vice versa in coordinating the activity on frequency. APRS is NOT a free-for-all, do-what-you-want-when-you-want operation neither is any other mode of operation. For me to make a blanket statement and say that the APRS network in Kansas City is only for SKYWARN or TRACKING or CHATTING, Etc. would be completely ludicrous.

> And i doesn't have anything to
>do with getting along with each other. I'm just bringing up some points
that would

>i'm sure bother more then a few APRS users. And Jim i have FCC part 97 in
the shack
>here like i'm suppose to have thank you Hi.

IT REALLY DOES, BILL. Just like on the SIG here. The freedom to disagree
in opinions with others is guaranteed in our form of government but so is
the right of the majority to rule. The bottom line STILL is cooperation.
You may disagree with me and you have that God-given right but the right to
dissent does not also carry with it the right to be outright obstinate.
(Note: This statement is not a direct slam on any particular person/entity
nor on any group of persons/entities. You simply refers to the public in
general!)

>I had no intention for this to be a
>flame, but i'm sure many will take it as such. Like i stated before i had
to fight
>hard to get this frequency coordinated (By the way i maybe very well the
only one
>in Alabama that does have a coordinated Digi frequency) to be very
concerned about
>how it's going to be used and why. I look at it no different then would any
other
>coordinated packet Digi. But then again if the majority of the users in
this area
>would agree with using it for Skywarn or whatever would be fine with me,
but that
>doesn't mean that would be the best thing to do.I'm still convinced that a
Skywarn
>APRS frequency would serve the community much better then trying to use an
existing
>network with already many users on it.

Now, that's a carefully worded opinion and I respect that. Of course, we
all have the right to turn our equipment off if we do not wish to support a
particular type of operation (that is akin to the "taking my toys and going
home" attitude of a 1st graders, though).

Ladies and Gentlemen of the APRS Community,

Another point regarding utilization of a frequency *besides* 145.790
is that some of the equipment dedicated to APRS is single channel
and/or xtal controlled stuff that *won't* goto any other frequency! I
just got several "nice" 20 watt radios (I love the sound of relays
going "click-clunk"...) running for use as trackers, digis, etc... I
can't switch some of my equipment, and don't have enough of the
"expensive" stuff (read that "synthesized") to accomplish everything
I'd need/want to in an emergency. I actually *NEED* to stay on
145.790!

>> very simple "shake detector".
>
 There was quite an exchange about that subject on ca.earthquakes back after
the LA quake.
 The warning they got with P wave detectors (purchased at Home depot) was
about 10 seconds.
 There is a guy in Fresno that has a system hooked to the Hopital paging
system that uses two sensors and will page you and tell you where the quake
is and its magnatude. It would be neat to get that into APRS.

I must of missed something along the way. What does ragchewing
(keyboarding) have to do with APRS? Why are hams ragchewing via APRS?
What part of "Position Reporting System" is relevant to keyboarding? Of
all the packet frequencies, nodes, digis, etc all over the country, why
are we ragchewing on 145.79???? So many questions, I know I'll get so
many answers....

Chris, AA7WD

Rendered body type: text/plain

Actually, APRS does not have anything to do with ragchewing, except that
is has the capability to send msgs between stations. The thing that it
(the APRS network) has going for it (actually against it in this case)
is that the frequency has a fairly low channel load when compared to the
better known and utilized packet freqs, which makes it attractive to
keyboarding that would not be otherwise possible on other freqs. Yes,
you could hold a QSO elsewhere (and SHOULD), but on a normally assigned
packet keyboarding freq you most likely would not have the capability to
QSOing over a 200+ mile distance in near real time. Your msgs (even if
one-liners) would be passed through so many nodes, digis, and backbones
and response times(ACKs) would be very slow when compared to the APRS
network.

Hi Bill,

It's been a while, how are you?

We moved our business to the house finaly, life is easier besides I get to see my 6 month old daughter more now.

The first SARA meeting was on APRS and given by Geroge N2AIG, I had WinAPRS running on one end of the room and George had DosAPRS running on the other, I also had a stand alone tracker in my truck, it was lots of fun.

I am getting lots of people interested in APRS locally, so it would be great to see your HF gate once in a while.

> I must of missed something along the way. What does ragchewing
> (keyboarding) have to do with APRS?

APRSdos REPLY/COMMENT: SImple. Practice, Practice, Practice.. hi hi. Keyboarding with APRS takes talent and will only work well in times of emergency if all users are familiar with subtleties of communicating with UI frames. Such as:

1) Knowing how to set up custom paths for each message

```
2) Knowing how to select dual paths for your data
3) Knowing to change your UNPROTO path when  you see an incomming
   message that is not using your default path
4) Learning how to be brief
5) Learning what paths work and which ones dont.
6) Learning how to bundle multiple messages along the same path so that
   you are not delayed waiting for APRS to change paths
7) Learning to ERASE un-acked outgoing messages when you see a human
   response form the other station so that your station will send the next
   line and not keep waiting for an ack.

Positions are worth 1000 words, but they are also like watching the news
with the volume turned off!  APRS was designed around FOUR mechanisms:

POSITIONS
STATUS BEACONS
MESSAGES point-to-point
BULLETINS

All must be exercised...

  All of it really I think. I can't "TALK" to most of the guys in Chicago I
can see from Rockford. Il. Yet APRS lets me chat or get "pertainent" info
back and forth. It's also on of the few ways I can make a contact over 100
miles from my QTH.
  I guess if it's not too important to you, it's not an issue and disreguard
any instructions telling you how to send/receive messages. I find it a great
feature.

Love it, do I see a T-shirt for the national gathering?

Does weather service pay attention to APRS? Yes, or at least they do here.
We have a remote station (more on the way funded by our emergency
manager) 30 miles west of NWS in Grand Fork, ND. During the last weather
event the communicator kept asking the remote station had indicated the
wind change yet. We could easily report when it had because the monitor
for APRS is along side of our remote PUP display.

The APRS transmissions are probably originating on HF or maybe someone is
set up to cross-band repeat.   Coulkd it be a frequency that is being
specifically used just for APRS?

>Does someone have their Alias set to RELAY?

That would explain why they are being retransmitted.

Chris,

Speaking for myself only, I will sometimes send a few one-liners to a
friend when I see that station on my map and I haven't run into that
individual in a while. If it looks like it is developing into more than,
say, 4 or 5 exchanges I will suggest we go to a voice repeater.

On VERY RARE occasions I will connect BRIEFLY to another station to get
a point across or to pass a brief message (like during a public service
event such as the Marine Corps Marathon, where I have been assigned to
provide a graphic display of the course (APRS) to the folks at the
Medical Tent AND pass occasional medical traffic to a station at a local
hospital or Red Cross location).

Once in a while I will catch Bob on the air (no doubt testing his many
releases, hi! 8-) and throw a greeting to him or pop a short question
that can be answered succinctly. (Like, "Is WB4APR-1 off the air, or is
it just me?")

And, once in a while, I will send a greeting to a station that is newly
arrived on my map; just to give them a "warm/fuzzy" and let them know
they're showing up.

But ragchew? Naaahhh! That would just bombard the frequency with
unnecessary UI frames, cause collisions, and bring all sorts of other
plagues down upon mankind..... 8-)

73,

Mark

All - I would like a map of western Washington, other than the BLANK one
that comes with the
APRS software. I'd appreciate someone sending some info via E-Mail in
UUENCODE or

via AX.25 in 7PLUS format.

The problem is that I'm in an APRS-FREE zone and have received nothing at all.
For your information my coordinates are: 4631.17N / 12255.10W / 380ft

Also, I have information on two amateur radio repeater sites in SW Washington:

1) Columbia Heights (Longview, WA)   4611.50N   /12258.01W
2) Ranier Hill (Rainier, OR)   4603.18N   / 12255.06W

For simplifcation, I'll use @ to represent degrees theta.

Now...what we want to find is the coordinates of the fox. (Xt, Yt)

Xt=(((X2tan@2)-(X1tan@1))+(Y1-Y2))/(@2-@1)

And now the equation for a line... y=mx+b

Yt=(Xt-X1)tan@1 + Y1

Angles must be in polar form!

Hi Chris,

I am using the keyboard function on APRS on 145.790 Mhz because the software has that feature and my license allows me to do it.

If all I had to do on aprs was just look at plot positions and not have any human interaction I would take it off of my computer and just look at the weather channel. At least there, somebody is talking to/at you.

I think a more appropriate question should be: "Who in his right mind would dedicate a computer, a tnc and a vhf and hf transceiver to an APRS plot position reporting system only?" I think that would get old real quick.

7e, George KD4FJ.

Chris,  you may have opened the barn door on this one...hi hi
we use APRS here is this area to send all manner of info as we "ragchew"
with
each other.  We send messages on aprs while we are on voice nets...we are
using
parallel nets here in NFL....voice net with an APRS parallel net...often
we are
conversing on APRS concerning what is being done on the voice net either
on
HF or VHF.  WE use the APRS net to check in on VHF and HF voice nets.
We are working here on ways to incorporate the APRS into our emergency
communications system and like working on a traffic net, if you don't
practice
and learn how to do it...you won't be able to do it during an
emergency...
APRS has possibilities we haven't even scratched to surface of...it is
exciting.
Try it ..you might discover it is a lot of fun!

Subject:        [APRSSIG:4624] Advanced Surveillance Technologies Conference II

The following is a excerpt from a message forwarded from Jim Warren's
GovAccess SIG. The conference mentioned deals with the broad subject of
```

```
individual privacy vs government surveillance by a distressingly large group
of techniques. I have put the program header and one topic from the program
dealing with vehicle location. Shades of APRS! I have the complete text of
the conference program message and will be happy to forward it privately to
anyone who asks. The whole thing is a little long for the APRSSIG and most
of it is not directly related.

It  has taken a while but I think I have finally figured out why there is
so much junk of a personal nature appearing on the SIG.
At first, I thought it was because people were lazy and the easiest way
to respond to a person was to hit the respond button, but I now think
I've stumbled upon the real reason.

It's something like, what Bob B. once referred to as "VANITY Bulletins"
that appear on ASPRS.

These people just want everyone to see their names and how witty they
are. (They my be half right)

If you wish to flame me, for this, you will have to do it directly, as I
will be signing off the sig for a short perion and I don't think the
mailbox will hold all the junk that comes accross daily.

APRSdos REPLY/COMMENT:  Every copy of APRS contains enough maps to at
least show the major highways and interstates.  If you use the MAPS-CHANGE
to enter the WES maplist, then you should get even more detail if you got
the WMAPSxx.zip file.  Now there is a PNWMAP09 file too with even more
maps...

I read through the APRS digest today (I'm an interested bystander at this
point, with a TAPR GPS-20 on order) and wanted to bring one point to light.
It is *very* dangerous to call ham radio a hobby! It is a federally-regulated
service in which we participate. Does that sound too legal-schmegal?? I'll
tell you from what I'm going through right now with my city for a 33 foot
tower with a Mode-B&S trio of antennas on the top that it is not.

  The first thing that the City Council/Planning Commission/anti-ham person
will try to get you to admit is that ham radio is a hobby. Then, they'll
say: "Well Bill and Jane down here on the end of the block say that looking
at the clouds above your house is THEIR hobby and they can't engage in it
if you put this eyesore up for YOUR hobby."

  The FCC protection (preemption) of state and local regulation in the
cases of antenna height (PRB-1) and RF Health and safety are founded on
two basic foundation blocks: 1) we are tested, authorized to operate,
and held accountable by the FCC. That means, when push comes to shove,
the FCC expect YOU to know what the hell you're doing! 2) we are a national
asset. This includes the currently in-operation communications networks
we have set up, the stations we have assembled that we can bring on-line
in time of need, the contributions we make to refining the communications
"art" or "science", and *us*, as people who know how to operate
communications gear, set up stations and communicate in a wide variety of
ways.

  I'll tell you this: I've engaged in the hobby of fly-fishing for stream
trout for the last 12 years. I'm not waiting for the Feds to preempt
a landowner's right to keep me off his land if I want to fish it!

  Be proud and know what an assets we and what we engage in really are to
the USA and the World as a whole.

Well, I'm on the middle coast, but I think I can explain it.  Pardon me
if I get the minor details wrong.

Earthquakes put out "P" (Pressure?) waves and "S" (Surface?) waves.
P waves travel faster, but S waves do the most damage.  If you're far
enough from the center, the P waves arrive enough sooner than the more
damaging S waves to give you a few seconds warning before the
dangerous stuff starts.  You MAY have time enough to duck into
a doorway, brace yourself, etc.

I think the P waves are compressional (the earth moves along the
direction of propogation) and S waves are longitudinal ( the earth
moves perpendicular to the direction of propogation, like ripples
on a pond.)

I agree with Paul in that amateur radfio is not a hobby (solely) but also a
service.  We operate our equipment so that we can 1) practice and refine
our operating skills and 2) test our equipment so that it is in good
working order when the need arises.

It is this that often makes amateur radio "appear" to be a hobby.  Although
we may enjoy this (who said a service could not be enjoyable), it is
important for all to realize that what can be provided by amateur radio is
a highly important and useful tool in times of emergency.

If I am asked, is amateur radio a hobby or service, the answer must be
both!  It is providing a service and prepares a service for the public good
(one of many things amateur radio does.).

Sorry, for the distraction from APRS....getting off the soapbox and
returning the SIG to APRS use.

This has absolutly nothing to do with APRS! There at least I've said APRS
three times! hihi

This is NOT a flame!

This is yet another amusing little story that happened here in the Ozarks
that I thought I'd leave you with before I head off to New York.

It is a known fact that Cows produce calfs. And calfs nurse from the Cows
utters until they are weened by the "mama" Cow. However, there are times
when there is little to eat, like in dry weather, and the calf continues
to suckle until its almost the size of the "ma" Cow.
```

It is also known that in dry weather conditions, like WE are having now, that the weeds grow like crazy. One of the most common is called Bitterweed. Dairy farmers have a problem in the summer dry weather in that the milk produced is actually bitter from the bitterweed being eaten. Ma Cows that have yearling calfs still sucking will eat the bitterweed intentionally to ween the calf!

The above are "well known facts"! Well known here at least. You just learn these things as you grow up. Now, it is also a fact that if you head out across certain areas of Arkansas, especially in these hills, you'll run across a few hillbillies. Yes, just like the ones on HeeHaw where they are laying around in the yard. Well, one of the ways the hillbilly supports himself is to have lots of children to do the "family chores". But, this causes a problem at the dinner table of not enough food to go around and "things" just happen. Things like the ma cow and calf.

(Here is a true story) One day me and a friend out travelling around the area and ran across and old road we'd never been down. So, we decided to drive on down it and see where it when. It was like HeeHaw never left! There is was, Ma, Pa, Sister, Brother, Sister, Brother, Uncle and Aunt in the front yard! We'd done it! Gone back to the dark ages (about 10 years ago around here)! Naturally we were invited in "fer dinner" (dinner here is lunch, and then there's supper). We went in a had biskets, gravy and squirel. Sat around, talked about the weather, fishing and squirel hunting. As we were talking, a young boy about the age of 10 peeked out from around a door and said, "Ma? Com eere!". I didn't think anything of it, but "Uncle" stepped in and said, "It's his Dinner time, he's still a nurse'n but she's try'n to ween em by rubbin green persimmons on herself". I could hardly keep a straight face! My bud and I looked at each other and decided it was time to go! But, before we could get out of the door, the little boy came running out of the back room yelling, "PA, PA, Ma's been eat'n Bitterweed again!"

The default alias for a digipeat on hf is "RELAY". I would say that putting RELAY in an hf path without a VERY good reason is a good way to clog the hf channel even more than it is.
Please try to refrain unless you have a good reason of which frankly I am hard pressed to think of one right now..

429. APRS & VOICE ON THE SAME FREQ?

From: Anthony_M._Werdein.Wbst139@xerox.com
Date: Fri, 13 Sep 1996 14:01:48 PDT
To: aprssig@tapr.org

Rendered body type: text/plain

```
To All,
        At our RAPS (Rochester Amateur Packet Society) meeting one of our
members heard that you could run APRS and Voice on the same frequency (news to
me : ).  And he wanted to know if anybody in the area was available talk about
it.  I spoke to him about your SIG and he doesn't have email, just heard about
it, well I told him that I would inquire and get back to him (which I am
doing).
        Can any and all who can please respond if this is so and how or what ,
or basically more information is hoped to be gathered to be passed on to help a
fellow ham.
        Please respond to me directly as I am not on your SIG mailing.
Thank you all for your consideration, and help.
73

It is referred to as "The Amateur Radio Service", not "The Amateur Radio
Hobby". First and foremost we must provide a public service. If we do not,
then all we are is (as my wife used to say before being exposed to the
wonderful world of PS events) "a bunch of old, fat men sitting around
talking on the radio.". The Frequencies we are allocated are a limited and
valuable resource. If you don't think we are privillaged to have so many,
try to apply for a new business allocation! (Sounds of "an old fat man"
stepping off his ponderous soapbox.....) >

431. Solution to Intermod Problem

From: Mark Humphrey <mark@y100.com>
Date: Fri, 13 Sep 1996 19:04:53 -0400
To: aprssig@tapr.org
Message-ID: <3239E895.2BD5@y100.com>
Rendered body type: text/plain

I recall there was a thread going a few months ago about intermod problems, but haven't heard much about this lately. I picked up a PAR Electronics model VHFDN152 2 meter "Intermod Filter" last weekend at the FARfest in Gaithersburg, and want to report it fixed my intermod problem, especially on the 145.79 APRS frequency.

My mobile rig is a Kenwood TM-733, which I chose due to dashboard space constraints. Although I'm generally happy with its features, the intermod rejection on 2 meters is poor. The "AIP" feature (which reduces the gain of the first RF stage) doesn't make much improvement.

I use this rig frequently for mobile APRS, however I've had severe paging interference on 145.79 (although many other amateur 2m frequencies were clean). Within a couple miles of most of the local commercial tower sites, the interference was so bad it would hold the DCD for several minutes and prevent my position packets from being sent. Further investigation explained why 145.79 was being hit so hard...

Two of the "RC Paging" frequencies assigned to Radio Common Carriers in the Philadelphia metro (and most other cities) are 152.24 and 158.70. When these frequencies mix in a receiver's front end, one of the third order intermod products is 145.78, just 10 kHz down from the APRS channel.

(2 X 152.24) - 158.7 = 145.78

Note that the deviation on the lower frequency is doubled, since its second harmonic is what actually mixes with the higher frequency to generate the product. Assuming 5 kHz peak deviation from each paging transmitter, the effective deviation of the product is 15 kHz, which easily spills over to 145.79. The "overdeviation" causes the modulation of the product to sound distorted and obnoxious, not to mention that paging signals are square waves to begin with.

According to the curves, the PAR filter provides a deep notch (nearly -55 dB) at 152.4 and appears to exceed 35 dB attenuation from 152.0 to 153.0 MHz. That easily takes out the lower paging frequency and eliminates the intermod. Below the notch at 145.79, the insertion loss is less than 0.3 dB, and even at the "worst-case" amateur frequency, 148.0, a loss of only 0.6 dB is claimed, which is comparable to most bandpass filters. The loss above the notch frequency is greater, about 4 dB at 160 MHz, but that still lets me listen to NOAA WX, the Broadcast RPU channels, etc. Loss across the 440-450 band is about 0.2 dB, and it will handle 50 watts without melting down.

```
So if you're having paging intermod problems on 145.79, you might want to consider one
of these.  I was skeptical until I tried it.  The manufacturer is PAR Electronics, 6869
Bayshore Drive, Lantana FL 33462.

```
Hi all,

     I've been in touch with Stu, and he assures me that his
WIDE-RELAY (WA2JNF-4) will be back up tomorrow (saturday).  I
hope he's right because I need that rig for the ARRL VHF QSO
Party!

     Temporary WIDE-RELAY N2ZRC will remain on the air until
about 1300 EDT Saturday.  Hopefully Stu will be back up by then.
Of course, if he comes back earlier I will terminate my service
as WIDE-RELAY as soon as I see he's back.  73

This is getting twisted around a little too much..  Remember that the
original poster stated that ham radio was NOT a hobby, but an art.  I
simply said it WAS a hobby.

I did not say that it was ONLY a hobby.  It certainly is a service...
the Amateur Radio Service.

Is there e-mail software out there that won't let you CLEAR, DELETE, KILL
or otherwise STOP a message you have just written before you send it?  I
have been seeing a lot of mis-addressed messages to the SIG that end up
"Oops" toward the end.

Those of us who use JUNO shouldn't be caught in the trap of not being
able to  remove our foot from our mouth before sending a message.   JUNO
 messages are sent from an Outbox and uploaded all at once rather than
real time on line where a message can't be recalled if there is an error
or Oops.

Pete

Huh? I certainly don't claim to know EVERYTHING there is to know about APRS (espcially since it's always being "tweaked" by Bob) but these two items have escaped me.

How can I "bundle" messages that are intended for two stations that are essentially in opposite directions without causing excessive QRM?

As for "dual paths," this completely confounds me. Please explain this concept. 73

Hi All,

Well, I finally GOT the USGS C-D for my area so I can make maps. The problem is it won't install!

The disk is 1:100,000-Scale Digital Line Graph (DLG) Data Hydrography and Transportation US GeoData Optional Format dated June 1993 for Area 1. The computer is a PC-clone DX2/50 running Windows 95 (with the latest updates from Mr. Bill's website.) I re-start the computer in MS-DOS mode, then switch to the C-D and try to install it. Every time I do so it says it's copying the files, then says I've got the incorrect DOS version (or words to that effect) after each file has been "copied!" I'm stymied! I'm stuck! HEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEELP! 73

Rendered body type: text/plain

Hi all,
   First and foremost let me say thanks to all of you who created this system (APRS) it's just great. Special thanks to the guys who wrote the programs.
   I have 8,943,015,805 questions, but I'll start with just a few. I am running MacAPRS version 2.6.

1. I can't seem to save a map zoom alias, which I read about in one of the docs. Is this possible in my version?
2. I can't seem to find a good explanation of how the unproto functions work. Remember I am a newbie. In order to set my path correctly I need to know what happens to my signal. Eg. I send via "wide,wide". All digi's who hear me repeat my signal (stripping one wide?). All digi's who hear the repeat, repeat again (stripping the second wide?) Or is the method of limiting repeating different. How do gates work? Etc. etc.

    Well, I think this software is worth enhancing. I know that the guys who write the code are loaded to the max and docs are hard to do on top of what they already do, particularly docs that answer every newbie question, like the 6 inch thick books Microsoft writes for a simple word processor. Could we in this sig help fill out the docs? I'd like to go over every menu command and create an explanation that any newbie can understand. If we compiled that kind of stuff, maybe the software authors could review it and add it into the documentation.

Again greetings to all KC6VLR John Lakeland

I don't think Steve slept last night, as he was having BBQ here in Atlanta with me until about 9PM.
Boy, will he be tired! He passes W7LUS-14 on I-75, but LUS didn't realize it until he got down here.

Yes, mobile, GPS APRS is fun and entertaining while on a car *OR PLANE* trip!

Makes me want to get the mobile HF going next time I take a long drive.
There are a lot of APRS dead areas on VHF!
Memphis TN is an area that is amazingly dead, and so is Missouri, down I-44.
Those KC guys need to get crackin down near Rolla.
, seriously- I am working with a fella on a possible Digi in Rolla.

The new version of AutoWx (supporting the new APRS wx beacon format) has been uploaded to the ftp site.

The file, AW2K40A.ZIP can be found at the tapr/software_lib/upload directory until it is moved to the tapr/software_lib/weather directory.

(AutoWx is a dedicated packet/weather program for logging weather values from Ultimeter home weather stations. It does NOT replace APRS but is used successfully with APRS in many areas.)

Version 4x does not require a weather station to be attached.

Please direct questions/comments about AutoWx via email to me - not the APRS SIG.

>
>
Greetings from Dave/WH6YC, Pacific Northwest APRS Coordinator.
I'll take Kevan's request for action, and respond WIDE in case it helps others.

Kevan, actually, there is already an area map which includes the Longview area, it's called the ORNWEST.MAP. Going north along I-5 is the Centralia map. The entire I-5 corridor for the PNW has already been mapped. To get these maps, plus all others in the PACNWEST, send me your mailing address and I'll send you a disk. If you had internet access, you would find these updated monthly on the TAPR APRS FTP site.

As for the "boondox" location, this is how APRS starts out in new areas. One person gets going, talks about it on local repeater, gives away copies on disk, etc. It works, and interest grows. You may already be within ear shot of the Portland APRS digi on 145.75. Note, this freq may be moving to 145.79 soon. Change your path (U key) to NWRA,NWRA,NWRA. If you can hit the first digi (AKA PORT), your signal will get to Spokane (YAKI,SPOK are the other alter-aliases). Lucky you. I can't reach that one myself, yet. I hope to extend the Portland signal to Seattle by placing an APRS digi on Bah Faw Peak (AKA Boistfort Peak) west of Chehalis at 3110 ft.

Want to hear more about APRS? I'll be presenting APRS at the Oct 2nd Chehalis Valley Amateur Radio Society (CVARS) meeting, 7:30 pm, at the Baptist Church in Chehalis.I'll bring latest copy of APRS and PNW maps with me. Talk-in 147.06. I routinely monitor this freq; perhaps you can already hit it.

Also, there will be an APRS seminar at the Digital Committee Conference (DCC), Friday, Sep 20th, 4-7 pm, near SeaTac airport. I'll be there, along with a bunch of other hams interested in APRS. Keith Sproul/WU2Z, author of the Macintosh and co-author of the Windows APRS software, will be presenting.

Next, I recommend you leave your station running APRS whenever you don't need the computer or gear for another purpose. Soon as I get settled, and household goods delivered, my station will be on the air full-time. Additionally I'm putting the two schools I work at (Pe Ell and Boistfort) on the air with weather stations. I also go standalone mobile routinely, and now have a Agrelo Engineering DFjr (THIS IS A WAY COOL PIECE OF

EQUIPMENT). If you have HF capability, tune in HF APRS on 10151 LSB. You could even use a SW receiver to process the sigs, if you don't have HF TX capability.

You can email me direct for further assistance, or call me (phone connected 9/16) at 360-291-3707.

Again, send me your address, I'll put disk in mail to you. Welcome to APRS, and don't worry about the loneliness that many of us experienced at first. If it makes you feel any better, just remember that the Pacific Northwest APRS Coordinator lives within an hour of you.

451. Re: [APRSSIG:4719] Help w/DLG (opt.) C-D

From: "John B. Leonard, Jr" <jleonard@tbcnet.com>
Date: Sat, 14 Sep 1996 12:09:14 -0500
To: aprssig@tapr.org
Message-ID: <1.5.4.32.19960914170914.006cdad8@tbcnet.com>
Rendered body type: text/plain

Here's what worked for me:

I didn't install anything from the CDRom, I just ran the DLG.bat program on the CD and installed the maps required on my HD.

Make sure you have a directory in your root called DLG. Put only one of the MKMAP*.exe prgms in there and nothing else. I think you can get them from ftp.tapr.org

Put the CD in the drive (assuming it's drive D:)

Go to Start, Run, Browse, go to whatever drive your CDRom is, and pick DLG.bat. Run it.

The biggest problem I had with any DOS based program was when I assumed that I had to go out of 95 and restart in DOS mode. Wrong!

By using Run... or using the Windows Explorer to pick the .exe file in a program that makes the DOS prog. work, then going to Files, Create Shortcut, then starting the DOS prgm from the shortcut, I had a WHOLE lot better luck. There are a few DOS-based prgms (DOOM comes to mind) that I have to modify the shortcut in "Properties, Program, Advanced, MS-DOS mode", that will restart in DOS mode. But 95 does it all. It works great!

Back to the CD...

Start D:\DLG.bat
Within a few seconds a window (DLG - GS Menu) will appear that will give you several options. Take the 1st one, Extract DLG Data..
you'll see a gridded map of the region covered by the DLG CD Rom.

Chose "View Quad" at the top. Move the mouse to the area and click. A more detailed map will appear.

Select Layers... (be careful! These DLG's have a lot of data usually. I would suggest to chose "Roads" to start with). When you're finished, pick "End Selection".

Next, "Choose 15' Cell", pick a cell, then right click when finished.

Next, "Output". A dialogue box will show up, asking you where you want to send the files from the CD. I use C:\DLG.

Hit enter. The CD will copy the maps to the directory you made. The name will be something like "Ar2rdf06". There will be no extension. Leave it that way.

Now, exit the DLG program, and enter the (thru Explorer) the directory where the DLG maps went.

Start the MKMap program. Each will give you different options, but I would suggest using MK100k2a.exe for starters.

Have nothing but the MK*.exe pgrm and the maps the CD put there in the directory.

The program will ask you things like:
1. What is the path to the map files? press Enter for default (c:\dlg), otherwise enter complete path info.

2. Next, depending on what version of MKMap yr using, it will ask for whether or not the file data is from the CD or Internet (blocked or unblocked). Answer showing that the program has to deal with files from the CD.

3. Enter a filename you want the new map to be called (try TEST). Don't add an extension.

4. Enter the latitude of the center of the map. Two important things here: if the center's lat coordinates are 41 deg 55.31 min, enter "41,55.31" (without quote marks). And the center of the map you're about to make HAS to fall in the DLG maps area. Otherwise, the program will crash.

5. Next do the same with the map center's long.

6. You'll next be asked for a number which will be the radius of the map. Enter something big, like 10 to start with. If you feel brave, enter +10.

7. If the program asks you for a multiple of maps, say you only want 1 to begin with.

8. If the numbers change at the top of the screen, and lines appear, you're making a map. If not, you've done something wrong, and you need to start over.

The program will produce TWO files, Test.map and Test.dat (or .raw).

Use MAPFIX to edit, combine, smooth, trim, scrunch, etc., and then you have a map that can used with APRS and WinAPRS usually.

Put it in it's own directory with MKMAPLST.bas. That will get the center coordinates and range. The new file, MAPCEN.txt, is sometimes found in the DOS directory.

Include the center/range into an existing maplist for the area, putting it in hierarchical (sp?) order, found in c:\aprs\maplists\ .

Put the new map, TEST.map, into c:\aprs\maps\

cross your fingers

For WinAPRS, just put the TEST.map into c:\winaprs\maps\. The 3000 pt limit on APRS maps doesn't apply here. MAPFIX can handle bigger maps than 3000 pts., it's just that APRS won't use them.

gud luck

Arte why not just install it under DOS, mine runs just fine that way.
I don't know if that software was meant to run under windows!.

Arte, try looking at the ver of dos that your running. Type ver(return)
then look at the ver# of dos in your io.sys file in the root directory.
some times a new version of dos comes out and it gets loaded to the hard
drive w/out updating the *.sys files.If that is the case you can go to
your sub-directory that dos is in and type "sys c:\"(return) and it
should update your sys files. Or you may need to go back to your
original disk and type "sys a: c:\"(return). I've seen problems like
this after uploading new DOS ver's. Hope this helps.

```
In the last couple of weeks, we have had probably 3 (or more) of
these nasty little storms batter the eastern seaboard of the United
States. I don't think I ever saw one of them move on my display. For
some reason, NE Ohio is not in a good location to pickup the info
being sent into the ether by the National Hurricane Center's amateur
relay station...because I still was showing Edwardo off the coastline.

   I know at least one of these drenchers passed through NE Ohio
the weekend of 6/7 of September, and it dumped some hugh amounts
of water into my basement. Is there some way we can get heading
and groundspeed inserted into the beacons? I would also like to suggest to get the maximum amount of
coverage, that the digipeater
list include a WIDE between the two GATE's I am seeing. For storms
of this inportance, I don't think GATE,WIDE,GATE would cause too
much harm to the network. The idea being it would allow more stations
to see the storm activity and perhaps provide better coverage to the
area directly concerned.

   Another problem I am noticing, the names of the storms are being
modified and I end up with 2 or 3 plots of the same storm. The first
letter will be capitalized and the rest all lower case, or there will be a
suffix added, or the name will be abbreviated, or the name will be
either all capitals or all lowercase.

   The floor is now open for discussion...

Hi all,
    OK here's my wish list (the short version). I would like to see a small program which might be called "APRSrecorder" which can run under Macintosh System 6.0.7, and which interfaces with my TNC (and radio, maybe receive only) and which simply records what it hears. Then when I start up MacAPRS I can read the "recorded" data and I haven't missed anything. I want this so I can use my old Mac SE with two floppy drives and no hard disk to run 24 hrs, thereby saving my better machine from excessive operating hours and making it available for other work without going off the air.

Also, I'd like a "box" which can plug into a serial port and talk to MacAPRS that I can hook up analog instruments to for reporting whatever, weather, radioactivity level, earthquake data, you get the idea (I hope). I can build circuitry to give an analog voltage for about anything, but getting it into the machine is beyond me. I'd be entirely willing to build such a box if I knew how.

I noticed a similar effect several years ago when I was running one of the KA9q NOS derivatives to sponge news from an nntp server. The machine ran 24/7, and I noticed that the time crept nearly an hour a week.

The machine was running PC-DOS 6, which had a driver available to periodically reset the DOS clock from the CMOS clock. This solved (or at least mitigated) the problem.

I don't know if M$-DOS has a similar utility or not.

Rendered body type: text/plain

Came across this on the net and thought I'd pass it along:

Global Positional System (GPS) technology, which has long been restricted to military and automotive navigation applications, is quickly heading toward consumer electronics and computer-based applications.

The Sunnyvale, California-based start-up SiRF Technology is positioning its SiRFstar architecture, which consists of a $49.95 chip set with software, as an inexpensive way for designers to deploy GPS in portable computers, cellular phones, and hand-held devices. Although SiRF's is not the first GPS architecture to target consumers--several devices were shown at a recent consumer electronics show--the company is betting that a low price will attract more portable PC manufacturers to GPS solutions.

Originally developed by the U.S. Department of Defense, GPS receivers accept spread-spectrum signals at 1.6 GHz from satellites, which in turn pinpoint the location of the GPS receiver and plot its location via mapping software. Will Strauss, president of the market-research firm Forward Concepts, forecasts a $10 billion market for GPS receivers by the year 2000.

"So far, though," says Strauss, "the receivers have been far too expensive for consumer applications." GPS solutions have also been compromised by inaccuracies caused by signal deflection off buildings and other structures.

SiRF's chip set, designed to detect these inaccuracies, consists of a receiver chip that converts a satellite's spread-spectrum signal into digital inputs for a
companion digital processor chip.

"Among general consumer applications," says SiRF chairman Dado Banatao, "you'll be able use this technology to locate a lost child, find a car in a crowded
parking lot, or dial 911 from a cell phone, knowing that an operator can locate you."

The market on which Banatao says he's especially focused is the portable PC market. But portable PC makers have been slow to adopt GPS. So far, Mitac is the only manufacturer to support the SiRF architecture.

Part of the problem of gaining GPS acceptance in the PC space has come from the lack of standardized digital mapping to serve as a platform for GPS applications. SiRF's software is positioned as such a platform, and its technology is extensible, so applications built around it can eventually incorporate--say--Multiple Listing Service references for real-estate firms.

SiRF officials said they hope to announce software developers and portable PC makers that support its GPS chip set this fall.--Sebastian Rupley

I'll be heading to SOCAL next month for a business conference. Arrival date is Saturday October 5th at about noon. I am supposed to head back to Atlanta on Friday morning the 11th.

I *may* stay a few days extra (if I fly the family out) and travel up as far as the LA/San Bern/Valencia area. (I have a friend who lives on the Mtn at Crestline)

What kind of activity on APRS can I expect, and on what frequency. Should I bother to bring it? If you have any info, or want to schedule an eyeball or other get together, please respond.

Thanks

Well the Mentor page now has 29 calls on it, so it's growing. Just wanted
to let the group know that i have posted many nmessages on the Sig and
some agree with me and some disagree (And some even are outright nasty),
so haven't you ever wondered what does this old fart look like that
writes some of these contravercial messages, well now you can see because
i have posted a picture of myself on the opening menu screen of the
my dedicated APRS webpage. By the way could use some more Mentors, like
to see one for every state that has APRS users. Guys i'm sure you have
needed help at one time or another, so help someone else if needed.
And by the way flames are welcome, i have learned to deal with them Hi.

468. Compaq Lap Top Information

From: carlt@icanect.net (carl taylor)
Date: Sun, 15 Sep 1996 10:17:28 -0400
To: aprssig@tapr.org
Message-ID: <199609151417.KAA16188@foo.icanect.net>
Rendered body type: text/plain

I read in the READ.ME file of APRS that Compaq Lap Tops that have the new
UART Chip may require a change to the Com FIFO 1 turned off. This setting I
believe is in the CMOS.

The Compaq must use some type of proprietary keyboard command in order to
get in to the CMOS. The conventional DEL during boot is not working?

Can anyone offer any suggestions? We are very close to testing out a new
hardware device with APRS that will allow it to work with 1 com port.

The whole problem of the names of Tropical Cyclone object names has to be
addressed this winter- maybe during the Miami Hamfest-
I believe that the Hams at the Hurricane Center are more worried about
getting
information than putting it out (I agree with this) but by next season my
software
should be completely debugged and ready to more over there.
I have software in Beta test to parse the positions automatically with the
ability
to output on 16 seperate paths/freqs. There has been some flack from central
Florida about the format of the positions and the Bulletins but I am more
worried
about the system right now than the bells and whistles. I think I could also
add the
ability to parse a .BK file directly and put it on the internet server at the
NHC.
Ken Swaggart has written a program that is available at the TAPR FTP site (in
the Weather section) that does it that way but his format and mine are
somewhat different regarding the names.
When the system works it is sweet- just do a screen refresh to erase the old
plots
and plot only the latest- all the objects for a storm have the same name from
update to update so no confusion about what plot is the latest info.

I just sent a msg to the sig abt the area of your concern. And had also
realized I forgot to mention that they are on 145.01.

I think that all networks that are not on the recognized standard freq of
145.79 ought to inform the software authors to create a text file with
that info.

Rendered body type: text/plain

Greetings all APRS users !

There have been several messages on the sig which touch on the above topic.

Did I miss something recently ? In the past the alias for general repeat on H.F. was ECHO, whilst on V.H.F. it is RELAY.

Needless to say, with the limited bandwidth on 30 Metres, the use of ECHO at the beginning of a path, should be used only in the most dire circumstances.

Another disaster waiting to happen can be found with the suggestion to use "GATE,WIDE,GATE" in another sig. Why a disaster ? Let's look at the Toronto, Ontario area as an example.

Using that path, and assuming that my station heard your frame, the first GATE would trip my station and shove your frame out on the 2 Metre side. The WIDE would then trip the four VHF APRS digipeaters that I can work directly from my QTH. Each one of those four digipeaters would, in turn, repeat that frame back, and the final GATE, would again trip my station. Result, I would send back into the HF side 4 identical frames ! (Multiply this by all the other GATEs in other cities in N.A. which can also hit one or more WIDEs on the VHF side; and the one frame you send, will neatly clog the HF side.

Okay, having said all of that, I think someone out there with some time, should write a refresher on how Level 2 or unconnected packet works and the significance of what we put into our paths.

Meanwhile, in the interests of growing the interest in APRS, could I again ask all those who operate stations on HF to use GATE,WIDE as your default path ? This way, you'll trip the various GATEs and be seen one APRS digipeater out from the GATE's QTH.

Comments are always appreciated; Oh, and as an old BBS sysop and a biker, I have a rather thick hide (head, too) so flames are also welcomed, hi !

I am in the Valencia area, however, I will be leaving for Hawaii on the morning 5 October and returning after you are back in Alanta.

>I *may* stay a few days extra (if I fly the family out) and travel up as far
>as the LA/San Bern/Valencia area. (I have a friend who lives on the Mtn at
>Crestline)

I assume that you will be in the San Diego area, since you indicate you may travel up as far as LA. You will find some activity on 145.790, although probably not early the quantity that you have in Alanta, based on what I have seen on the Java pages of the internet.

>My hobby is tracking Vehicles and other things using Ham Radio and APRS. Ask
>me how!

If you are familiar with this area (Valencia), you know of the mountain range between this valley and the San Fernando Valley and another range to the south also. This makes it quite difficult for our group to see anything in the Orange County and San Diego areas.
We have also been plagued with getting 145.790 offically recognized as the APRS Frequency, however, who hasn't.

```
  I doubt if anyone would notice you driving around in the Valencia
area in a vehicle.  There are about 12 of us registered with APRS
but only 3 or 4 who are working it regularily.

   If you ever get the opportunity to be in CA and the Valencia area
on the third Wednesday of a month, you would be very welcome to attend
our club meeting.  Our Web Page is at  www.smartlink.net/~scarc  and you
will find me listed as the webmaster.

   Have fun in SOCA, sorry to miss you.

  73, Jim
```

Hello to everyone on the SIG!
I have for sale a PacComm HandiPacket TNC with three cables, one of which is
wired for the standard pinouts for alinco, radio shack, etc handitalkies and
two additional unterminated cables for your own customized uses.  This is a
small, rugged, portable tnc with internal rechargeable battery pack that
supports GPS!
This is the same TNC as is used in the MIR Space Station.
Price Paid New - $229.00        Asking $160.00  OBO

I also have for sale the Kantronics KPC-9612 1200/9600 Dual Port, Dual Speed
Tnc.
Price Paid New - $199.95        Asking $140.00  OBO

Both TNC's come with original boxes, manuals, cables, etc.  Prices will
include shipping!

Interested parties can contact me via e-mail at AC6JA@AOL.COM or directly via
phone at (415) 573-7720.

Thanks!

Mike  AC6JA

You must be using a SSID of -1
a SSID of -14 or -15 is a truck and -9 is a car

That is the quick and easy way to do it.
Bob has a list somewhere in the doc files of another way.

John, I have constructed (successfully after several agonizing days) a
similar system. The GPS-20 requires a "stiff" power supply of +5 volts.
I spent several days on this problem thinking that I had a faulty GPS. It
some extra measures on my part to successfully get the GPS-20 to start up.
I finally put a really large (I think I put a 2200 uF cap across the
connection from my 7805 regulator to the GPS-20. I have had no problems
since I did that. This may be overkill but I tried 10 and 100 uF and they
were marginal with my battery supply that I use with the tracker. I even
found that several of my bench supplies were not stiff enough for the 20.
I will be putting my tracker back on the air next week while I motor to
work, play and home. You may see me although we do not have a good link
out of Delaware to the rest of the world. As my friend says "We live in a
technical and RF Black Hole".

Great John but i need to know for what area of the contry or state you
are able to help with. I don't know if you have internet access other
then Juno, so i don't know if you see the web site or not?. But that's
one thing i need to know.

As mentioned before, I see MOST stations coming thru my local GATE with
three WIDE's in their path.

Could it be that the local WIDE is adding an extra WIDE to each path when
it digipeats onto VHF?

It was a great hamfest tho a little un-crowded. The NIAN group from
CHicago was there in quite a few numbers and we had a great little dinner
and chat. Keith Sproul representing Mac and Win APRS and I were there.

During a DF replay, I noticed how much better the DF bearing lines would
look if their length got shorter as the DF chaser got closer to the FOX.
We discussed it and I will implement a RANGE digit in the DF report that
is proportional to the Map scale that the oriinator is on when he makes
the report. Presumably he will be zoooming in as he gets closer and this
will make the bearing line shorter... I think this is a neat idea.

Currently the DF bearing is BBB/N0Q. The 0 was just a placeholder all

along (clairvoiance?) Anyway, I will change the DF format to make
that digit represent RANGE as the 2-to-the-Rth power.
That will handle ranges between 1 and 512 miles....

I have 200 messages to plow through, so it will take me some time to
respond...

Again, good job to the NIAN group in CHicago, they seem well organized and
were very supportive and operated an APRS booth during the whole show....

           /                  \
          /                    \
         /                      \
        /                        \
                2-mile maps
        __________________________
        |            |           |
        |            |           |
        |     NW     |    NE     |
        |            |           |
        |____________|___________|
        |            |           |
        |            |           |
        |     SW     |    SE     |
        |            |           |
        |____________|___________|
```

which is pretty standard APRS mapmaking procedure for urban
areas.

     I'm getting as far as making the "CC" map of the 8-miler,
which has about 3300-odd points (I'm using the 8- range...less
than default detail.) The map gets drawn then, a fraction of a
second after it starts chaining segments I get the following
lovely message:

     Subscript out of range in line No line number in module
MK100K3 at address 08F5:1ADD

Hit any key to return to system

which gets to be awfully tired after seeing it time and time a-
gain, trying to simplify things for the machine by running the
MK100K3 in a "DOS Window," going from the 8+ range to 8 and
down to 8-, running MEMMAKER to get more lower memory to play

with and banging my head against the wall to shake loose the
cobwebs! I am reminded of the QSL card I once got picturing a
computer on a desk displaying the "Hit any key..." message and
the operator standing over it with a sledgehammer poised to go!

I've unzipped all of the road & hydro files of the desired
quads from the selected areas AND their abutting quads. The
computers in question (I've tried it on both) are a DX2/50 with
12 Mb of RAM and a Pentium 75 with 8Mb of EDO RAM.

What does this message mean? How can I avoid it? What am
I doing wrong?! 73

Arte Booten <N2ZRC@gnn.com>

A coupla folks told me abouut a settup disk from Compaq.. I got it from
their internet site.. I did not access the " comfifo 1" command which the
aprs readme spoke about...

The strange thing is that other comm programs (telix,etc.) will talk to the
tnc, but aprs just locks up when it trys to iniciate the tnc..I have gone
over the system initapr file and can not find anything out of line....

I realy need someone with a bright idea.. This has gone one for a week and
untold hours now... It did work until 2 weeks ago..Reinstalled aprs and
everrything else i can think of...

APRSdos REPLY/COMMENT:  The default path for APRSdos is NONE and the
MYAlias is ECHO.  If stations do not hit CONTROLS-BANDS-HF to tell APRS
they are on HF, however, then APRS does not know it and assumes the
station is on VHF so uses RELAY...

497. APRS/HSP "Be Prepared"

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 16 Sep 1996 10:26:32 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.960916101807.20963J-100000@arctic>
Rendered body type: text/plain

In preparing for my trip to Peoria (fly in and rental car) I was going to
be using a different combination of GPS/TNC and laptop. It would be risky
to depend on my HSP adapter untested with this combination.

APRS RECOMMENDATION: Everyone with a GPS should add this little GIZMO
to their bag of tricks so they can operate GPS mobile with ANY TNC, any
GPS and any LAPTOP. An SPDT switch ALWAYS works. Use a push putton to
normally pass the TNC data to the PC. WHen you push it, the GPS data is
switched in. SImply wire a back to back DB-9 with a GPS connection and a
3 foot wire to the hand held push button and a GPS connector. Put APRS in
SPM mode.

Whenever you want a posit, push and hold the button for 2 seconds.
Perfect for marking intersections or landmarks too... Nice to have in
emergencies when you may be using a strange laptop, or GPS, or TNC...

*** Use OPS-DIGI-ALT and select your alternate path and percentage to use.
>
> >6) Learning how to bundle multiple messages along the same
> >path so that you are not delayed waiting for APRS to change paths.

APRSdos REPLY/COMMENT: If you have many messages to send to different
stations, try to bunch them together.  IE: Enter all the messages to the
northbound route first, then enter all the messages to the southbound
group, then enter messages to the west group.  THis way APRS only has to
switch paths three times instead of back and forth between every message.

There is a new WIDE-RELAY digi now operating on Blue Mountain, about 6 miles NW of Harrisburg, PA, using the call N2CHV-2. This site is 650' AAT and offers very good coverage of the Harrisburg/Carlisle area (Dauphin and Cumberland Counties) including the following major highways:

I-76 (PA Turnpike) west to Blue Mountain Tunnel
I-81 and US 11 south to Chambersburg, PA
I-83 south to York
US 15 south to Gettysburg
PA 283 southeast to Elizabethtown

There is some coverage in Perry County on US 11/15 north of Harrisburg, but this is limited by terrain. The eastern coverage overlaps slightly with N2CHV-3 on Eagle's Peak which is 43 miles to the east (near the junction of Lebanon, Lancaster and Berks counties).

I hope to have a remote WX station installed at the site within a few weeks, thanks to Gary, N3HCP who is donating a Ultimeter-II.

I look forward to your signal reports -- please send to mark@y100.com or N2CHV@WB3JOE.

73, Mark Humphrey N2CHV

Ralph,

Seems spotty.  Where I am located, Pasadena area, APRS seems pretty active;
however, when I go over into the Northern part of the San Fernando Valley, the
activity drops off drastically.  I don't have APRS running, I just run a
tracker but audibly monitor the channel.

I'm just getting back into the swing of things here.  I just moved back into
the area from Colmbia, MD.

Hi Carl;

  When you find out what it is, Please let us (me) know as I'm having the
same problem.  I have put an extra 2 megs of ram into my compac but have to
hit F1 each time I boot up otherwise the little monster will not run.  Any
suggestions out there would be appreciated.

Thanks

Rendered body type: text/plain

```
On Sun, 15 Sep 1996, Richard Amirault wrote:
> I see MOST stations coming thru my local GATE with three WIDE's

APRSdos REPLY/COMMENT:  I just looked at my DIGI page on HF (hadnt done
that in months!) and he is right!   Over 50% of the paths are
inappropriate.   20% of them are BADNEWS, and 20% are meaningless and go
```

```
no-where...

RULE:  There should never be more than ONE WIDE after a GATE.  Yes you can
go more hops (if absolutely necessary), but you must use a specific call
beyond the first WIDE otherwise you clearly do NOT have a specific
purpose.

VHF stations should not be routinely beaconing via a VHF GATE onto HF.
I see over two dozen!  Is OK for special, or for single packets, but not
as a rule!

We need the HF stations to try to educate these newcommers.  PLEASE be
courteous. These are new users who simply dont understand. Take the time
to send them a polite message offering to help explain the best pahts to
use and the ones to be absolutely avoided...

BE NICE!!!!  Also BE SURE TO CHECK THE HEARD LOG!  Do NOT jump on someone

for a one time mistake or a one time special event...

We must do this, or HF10151 will become useless...

```
1. Pre-launch check in 7 am CDT (Indianapolis time)
2. Launch time 7:45 am
3. Flight duration: approximately 3 hours
4. Camera video frequency: 439.25 MHz (vertical polarity)
5. Amateur voice repeater  FM receiver on 444.85 MHz and 52.525 MHz
   (6 meters is best). FM transmitter on 144.30 MHz (vertical polarity).
   Note: You need a ham license to transmit.
6. GPS and amateur packet data info: FM receiver on 446.0 MHz with
   packet TNC for 1200 BPS
7. Pre-launch CHECK IN frequency:  2m: 145.37/r, HF: 3871 kc

Web Page: http://klingon.sc.iupui.edu/~pacer/new_augusta/windtrax.html

SUBJECT: NAPA/WindTrax-10 Balloon Experiment FAQ
                          WINDTRAX-10
                                 Prime launch date: SAT 21-SEP-96

Flight Director: Chuck Crist, WB9IHS
Flight Sponsor:  New Augusta Public Academy

TIME:        1200-1300 UTC (0700-0800 AM Indy time)
LAUNCH SITE: 5 mi NW INDY

Pre-Launch Freq:
   Check-ins (HF) on 3870 +/- 1 kHz, local on 146.97(-)/R
   Nets will begin at 1130 UTC

Balloon Type: TA-1200 Weather Balloon
Flight Assembly: 70-ft long consisting of balloon, parachute,
   crossband repeater, GPS packet & ATV equipment all contained
   in separate starfoam boxes and connected by 1/8 inch nylon
   line.
   Total weight: approx 9 lbs.  ATV is heaviest at 4 3/4 lbs.

Flight Package Freqs:
   Crossband repeater: Down 444.85 & 52.525 MHz FM vertical
   polarization @ 50 & 100 mW Pout.  Up 144.3 MHz FM.
   GPS Packet: Down 446.0 MHz vert pol @ 750 mW Pout
   [transmitting GPS "gga" string].
   ATV: Down 439.25 MHz vert pol @ 1.5 W Pout.  [Cable Ch 65]
   Antennas: All are vertical polarization.

Climb Rate: Approximately 1000 feet per minute.
Max Altitude: Approximately 100,000 feet AGL.
Flight Duration: 2 1/2 - 3 hours.
Flight direction/distance: Approx E to SE of launch site &
   35-50 miles.
```

Flight packages:

Crossband Repeater by Paul W9DUU:
 2m rcvr to 6m & 70cm xmtrs, with voice ID & NiCad power supply. Antennas are 1/2 wavelength wire on top and bottom of self-contained and separate box.
GPS Packet by Chuck WB9IHS:
 Garmin GPS rcvr, controlled by PacCom packet TNC & downlinked on Tekk 70 cm xmtr. Self-contained separate box with lithium power system. Antennas are 1/4 wave on 70 cm & strip line 1.5 GHz GPS rcvr.
 Audio beeper is attached to outside of this box.
ATV by Terry KT9V:
 Two B&W CCD cameras plus WB8ELK color video IDer board and downlinked on WYMAN ATV xmtr via 1/4 wave vertical antenna. Self-contained in separate box with lithium power. CCS cams are aimed Horizon & Up views and controlled by solid state remote switching.

MISC:
1. Balloon fill is approx 290 cu ft of helium at surface.
2. Balloon dia approx 6 1/2 ft at surface & 18 ft dia at 100k ft.
3. Flight Assy recovery is by DF chase teams.
4. All Amateurs are welcome to participate.
5. Parachute is 4 1/2 ft dia by KB9BSV.

FAA DATA REQUIRED by FAR101:

1. BALLOON ID: WINDTRAX-X-96 WB9IHS
2. LAUNCH DATE: 21-SEP-96 (SATURDAY)
3. TIME: 1200-1300 UTC

4. LAUNCH SITE: New Augusta Academy, Indianapolis, IN
 Lat 39.866667 N, Lon 86.233333 W
 Elevation 800 ft MSL (244m)

5. CRUISING ALT: Max Altitude approx 100,000 feet

6. FORCASTED TRAJECTORY & EST CLIMB TO 60k FT:
 A. 50 miles SE of launch site, while climbing to 100k ft, then descending to surface by parachute.
 B. One hour to 60k ft & 90 minutes max altitude.

7. PHYSICAL DESCRIPTION: Balloon is 8 ft diameter weather balloon made by KAYMONT (same used by NWS). Entire flight assembly is 70 ft vertically in length and contains one balloon, one 6-ft parachute & three separate starfoam electronic experiment packages connected by a 1/8 inch nylon line.

8. TOTAL FLIGHT TIME: Three hours, Approx.

9. FORCASTED LANDING TIME & LOCATION:
 A. 1500-1600 UTC
 B. Approx 50-60 miles SE of launch site.

APRSdos REPLY/COMMENT: Thanks for the good news! (I see it fine here in MD). THis balances the general bad news currently in our area:

 My APR-1 digi is down. Killing our area, and Gate
 The PAX River digi is down severing south maryland
 The Charlottsville DIGI is donw cutting off central VA

```
  WA4TSC-1 is down, killing northern VA.

Basically, from the biggest east coast net, we can now barely see anyone!
ARGH!!!

I was looking at this over the weekend and found 38 HF stations with
WIDE,WIDE,WIDE in there path. I also turned on my HF rig and the path was the
same there so it is NOT a local station adding a wide, it is how it is being
sent.

The other supprise is that many of the stations doing this are the long time
HF stations that are on this mail list so it is not a case of new users coming
along and making a mistake.

The "little GIZMO" SPM Switch is available ready-to-run from Blackjack Antennas.
Cost is $20.00 plus $3.00 s/h.  Specify RS-232 connector types for both
laptop and TNC when ordering!  Allow 2 - 3 weeks for order processing....  I
have several of these units already built and ready for shipping....

```
John,

>From the data you provided, it appears that you do not have valid GPS
data. The data shown is from the $GPRMC message and the receiver is
looking for satellites based on a time of 17:25:15 UTC on 15 Sep 1997.  I
have seen this type of data transmitted by my GPS-20/MIM when I my
antenna is shaded for more than 30 seconds.

Since your GPS is trying to acquire satellite that are probably not there,
you will need to either reinitialize your time and date (and probably your
position) or give the receiver more time to get a good position fix.  Also
make sure your antenna has an unobstructed view of the sky.

73s
Terry, KI0BF

>>> John L. Gafford <JohnLGaf@gnn.com> 09/15/96 01:45pm >>>
I have a Garmin 20 engine tied to a Clement MIM Module per pinouts  in
documentayion for both units.  It all seems to be working OK.  The MIM
checks out fine with MIC104.EXE software, and when tied to  a
transciever, the assembly put out beacons(correct BT), andan
apparent GPS fix, but of strange format. i.e.,
<call sign>,172515,V,,,,,,,150997,,?GPS FIX"  The Garmin has been  on
for several hours, and should have acquired a fix, but the NMEA
sentence doesn't look right to me.  Any ideas, anyone?  Is the  Garmin
20 working properly?  Any help will bw sincerely  appreciated.

     When you use the I(nput)-M(y) command you are asked which
```

symbol you'd like to use immediately after you tell it your latitude & longitude.

Alternately, go to your root directory and look for a file called cfig##.apr (where ## is a number, probably 75b) and open this file with a text editor. The first line of this file will be your POSITion packet. The letter immediately to the right of the W (of West longitude) determines which symbol you'll be on the screen. For a key to which letter is which symbol, see "SYMBOLS.TXT" in the README folder included with all distributions of APRS. 73

I had some locals trying to do that a few months ago and thanks to the
firmware in the tnc, they were excluded from any digi'ing until they
complied with my path wishes. Worked perfectly. If your firmware  supports
it, you can prevent unwanted individual digi'ing...a great feature and
upsets no one...they didn't know what they were doing and as soon as they
read their mail (sometimes it took a week or two), they changed their digi
path away from gate'ing on to hf from vhf. At that point, I took their
call signs out of the digi exclude list and every one was happy.

>We need the HF stations to try to educate these newcommers.  PLEASE be

This *has not* been my experience. True, if you use "CONTROLS-BANDS-HF" to tell
APRS you are on HF, it does change MYAlias to ECHO, but in my experience APRS
defaults to the prior path used on VHF *unless* you manually change it yourself.
So in that respect, I can see how we are seeing all those RELAY and WIDE
stations direct on HF :-)

WARNING!

Don't let MINDSPRING bill you for services you don't use.

I got a letter from them because the bought out PIPELINE (PSINet)
earlier this summer. They wanted to get my preferences before they set
up my new account at MindSpring because the PIPELINE account was
closing.

Whoa Wait a Minute!

My PIPELINE account was closed months ago during the trial period, and
there was never any billing, UNTIL TILL THIS CREDIT CARD CYCLE. Now I
am being billed for August 96 service.

Read the letter from MindSpring carefully. If you don't respond by
September 30, 1996, MindSpring will set default values for you and
assign what they want for a LOGON name.

This may not be directly APRS related, but a number of us on the SIG have
had PSINet/PIPELINE and are current MindSpring users. A word to the
wise.

I hope this won't affect too many, but I have knowledge that the same
rip-off story was mailed (and billed to credit cards) to others in my
own area here in Virginia.

Rendered body type: text/plain

```
CHecked HF paths today and of the 30 or so questionable baths, only one
was active and on the air.  So apparently all the rest were just mistakes
or one time tests.  The one was a mobile-9 in Kansas city using the
path of RELAY,WIDE,GATE,WIDE.   An OPS-REPLAY shows he has traveled more
than 60 miles so he is probably on a special trip and I HAVE NO PROBLEM
WITH HIS INTENT.  This is just a good eample to make some comments.

1) PACKET LENGTH.  Packet success is inversly proportional to length.  A
minimum posit takes about 50 bytes.  Each digi hop you add requires 7 more
bytes.  Using 4 hops will reduce your success rate by over 50% !

2) He needs to be informed that the final WIDE is accomplishing nothing

3) If he meant to use R,W,G,G,W, then his success rate is reduced by 70%

These reductions in success ARE AT EVERY HOP!

Another way of looking at it is that this packet is carrying 35 bytes of
position info, 15 bytes of overhead, and 35 bytes of digipeat info...

(Thats another reason for the WIDE-N algorithm!  WIDE-5 will only add
7 bytes to the packet, instead of 35!)

>Yup you are showing up as GATE,WIDE,WIDE,WIDE here.

>   Bill

Then something is seriously wrong somewhere. I just checked my unproto at both the software (program) and tnc level and my unproto path is set to GATE,WIDE on HF and WIDE,WIDE,WIDE on VHF. I also looked in my history file for all transmissions that I originate and all HF transmissions show GATE,WIDE.

Further, I examined my entire history file and NO ONE has digipeated thru me with a GATE in their unproto, so I am not gateing any vhf packets to hf.

How then, could I be showing up as GATE,WIDE,WIDE,WIDE as Bill noted above?

I am beginning to suspect that APRS is showing something that is not happening, or WinAPRS is lying to me about my packets. I have no indepedent way to monitor my hf packets to verify that what the program is set for and what the tnc is set for and what my outgoing screen is showing me is "accurate", but my gut feeling is that indeed all my hf packets are going out no more than GATE, WIDE as they leave my station.

So, Bob...or anyone else with an opinion...what is going on?

Keep in mind, someone on the list observed that "many long time hf stations who should know better are sending out gate,wide,wide,wide". I find that very hard to believe, unless there is a software anomoly causing it. Obviously, I know better, am set properly and yet Bill is convinced by what he sees on his screen that my packets are going out on hf GATE,WIDE,WIDE,WIDE.

(I'm not taking issue with you here, Bill...I am TOTALLY mystified, because Bob's recent message of yesterday said he was seeing the same thing and that it was all wrong.)

If I'm not doing it, and my users aren't even using a GATE command, where is this GATE,WIDE,WIDE,WIDE stuff coming from that seems to be attached to my call? (And the calls of many others, from the reports we are seeing on the SIG) 73,

==================================================================
I believe what you say is correct.
Here is a suggestion of how I have somewhat solved this problem.

Pick 3 hf stations in 3 different areas. I often use ( please excuse me
using
exact calls) VE2JOR, W7LUS, and KF0ZH
1. temporary set my path to one of them.
    a. VE2JOR, GATE
    b. send a beacon or Ping
    c. tune up freq until I get no return
    d. do same tuning down
    e. set my vfo between the two settings.

Thanks for the space on the ssig.

N0AN*>GATE>WIDE>APRSW:@161502z4158.25N/09333.36W_060/001/T058/R000/P000/B0
         ^^^^^^^^^^
```

I searched an entire 595K history file for any packet containing:

```
GATE>WIDE>WIDE>WIDE     and got nothing.

I searched the entire file for WIDE,WIDE,WIDE on port 1 and got nothing.

I then searched for GATE>WIDE>WIDE  and got the following:

p1 W1ON-3*>W7LUS>GATE>WIDE>WIDE>APRS:!4230.27N/07114.43W&BOSTON GATEWAY
[30M< p1 W1ON-3>W7LUS*>GATE>WIDE>WIDE>APRS:BLN1     :PORT DEFINITIONS:
APRS [6=10.1 p1 W1ON-3>W7LUS*>GATE>WIDE>WIDE>APRS:BLN1     :PORT
DEFINITIONS: APRS [6=10.1 p1 W1ON-3>W7LUS*>GATE>WIDE>WIDE>APRS:BLN2
:STATs 6H>3V 1531 [47/hr] 3V>6H p1
W1ON-3*>W7LUS>GATE>WIDE>WIDE>APRS:!4230.27N/07114.43W&BOSTON GATEWAY [30M<

As you can see from the info excerpted from the file, the vast, vast
majority are set GATE>WIDE, which from what I have been told is correct.

So, if there REALLY are so many stations ACTUALLY sending out unproto

GATE,WIDE,WIDE,WIDE on hf....why don't they show up in a 595K history
file? This file has over 7000 lines of APRS packets and is from about a 36
hour period. Any ideas?

At this point, I don't believe I am sending out any HF packets
GATE,WIDE,WIDE, WIDE, despite what some people are seeing from their
software. I also doubt whether any significant number of others are doing
it either. One way or another, someone's software is lying to them, we are
misinterpreting what our software is showing us, or we have all been
infected by some brain softening virus ...

I hope we find out. If I am contributing to a mess, I wanna stop...but at
this point, I can't find any information that supports that assumption.

```
Hi APRSers,

This is not directly related to APRS, but I don't know who else to ask.

 I have a bunch (about a dozen) Midland Model 70-530B UHF-FM commercial
radios I want to reprogram to the local 440 repeater freqs. They use a UV
erasable EPROM to set  the channels. I have access to a PROM programmer, and
am looking for the software or format to reprogram these things to the ham
freqs.

Anyone have any ideas, or to what ham newsgroup I should direct this question
to?

These things were free, so if they can't be reprogrammed I guess they end up
in the
dumpster, where they were originally headed!

Please reply directly to me at kswaggart@aol.com so as not to add more
non-APRS messages to the SIG (than I already have)!

73, de Ken, W7KKE

To: aprssig@tapr.org
Message-ID: <s23e9a79.047@mdc.com>

Rendered body type: text/plain

```
I recently finished wiring the MIC Encoder circuitry into my MIM/GPS-20
box. The position, heading, and switch info appears to be accurate, but
I am getting extremely large velocities reported on the APRS display.
When I was stationary, the velocity was displayed as 140 knots and I
have seen speeds go as high as 250.  When I was driving at about 40
mph, the speed was displayed as 450.

I have seen this happen on versions 76d and 77b of APRS (the only
current versions I have).  When I was stationary, data output by the
GPS-20 indicated that velocity was 1.0 knots, 6 satellites were being
tracked, with a PDOP of 2.2. I am using the MIM 1.04 with MIC 1.01
software.

Data received at the home station was:
     KI0BF-5>S8TX4S-1/Vv.F* />

When I hooked the car icon, the following info was displayed:
   Pos:@142025/3848.43N/09018.42W>019/140/MIC/M2/In Service..

I was wondering if anyone else has seen this problem of large
velocities when using the MIC Encoder?

73s
Terry, KI0BF

In addition, there is an APRS HomePage. Right now the home page is located at:

http://hurricane.net/~epdkr/aprs.htm

This location will change as soon as I find the time to relocate it to my new
domain: www.eyephrase.com. This change may take a few days, so in the mean time please use the 1st address listed above!

During the first week or so of October, I will also be adding a KAM+ to the station
for cross band, i.e., 30m and 2 meter APRS. APRS on two meters in Seattle is
145.79. I have on occasion been monitoring this channel, but not much activity. Hope this changes with the addition of the KAM!

n8chb@tir.com said:

>I don't know but I am not seeing all the WIDE's that everyone is talking
>about, and your definatly not sending them.

>Could it be a program?

This reply to me is typical of about five I have received.

It is pretty apparent that I am NOT sending anything out on hf GATE,WIDE,WIDE,WIDE. All my packets are going out GATE,WIDE and that's it.

Bill...if you are still reading the sig, what software are you running that shows this path? Please post the relevant lines from a history file showing the problem.

Bob (apr) says he has seen NO GATE,WIDE,WIDE,WIDEs at all, but sees plenty of screwy paths. (And mine is NOT one of them).

Since you reported seeing mine weirded out, how 'bout posting the packet and letting us know what software you are using. It sure looks like a program bug at this point.

Several WinAPRS users have told me they don't see any such problem on me or anyone else. If you are running dosAPRS,

```
maybe that would be a starting point.

There have been a number of comments regarding the Garmin 20 and the power
supply requirements needed.  I, too, have had a terrible time using most
home supplies even with large 2000 ufd caps on the output of the 5 volt
regulator.  Apparently, one must turn the unit on from a stiff five
volt supply, not necessarily turn on a supply in which a large capacitor
needs to be charged.  Can anyone confirm this?
     Another question of interest----is the five volts on the antenna lead
isolated to the input of the receiver at 1575 MHz?  In other words, can I
use a MMIC at the base of an antenna and expect the Garmin 20 to sort out
the DC from the RF signal? I suspect so!  Cliff Buttschardt  K7RR

Many of you out there reading thing this SIG must enjoy APRS, that much
is obvious.  But how many of you take your system out for mobile use on a
regular basis?  If you are not one of those people, is it because all the
different cords get in the way and make it too much of a hassle?

What about a PCMCIA TNC?  It seems to me that the time is long overdue
for such a device.  Think about it for a
second.... ONE cord between your laptop and radio, the TNC's power would
be supplied by the computer NOT an additional cord!  Talk about USEFUL!
This would eliminate the mess associated with mobile packet.

Now, those of you with a GPS could just use the spare RS-232 port for
that.  There would be no need for special adapters that create even more
tangled cords.

What would you like to see on an PCMCIA APRS compatible TNC?   Here are a
few of my ideas;

1) A telephone type 5 or six conductor cord with an X-Jack style plug.
2) APRS compatibility by using the laptops spare RS-232 port.
3) Able to directly address the laptops memory (RAM or HD) for expanded
maildrop capacity.

Also I would have them ship it with an extra "NEW INDUSTRY STANDARD" plug
to force all the radio manufacturers to install a simple jack on the
front or side of their new mobile radios for easy access.
Which radio manufacturer would NOT want to conform to ease of customer
```

```
use?

I think it's time we start a letter writing campaign to the TNC
manufacturers.  Tell them what we want!

Whoever comes out with one will sure sell a heck of a lot more of them
than the radio people with hundreds of different models to choose from!

Kevan-  Please take my comments with a grain of salt.
It is a good idea, and I have some comments based upon my dealings with
manufacturers of radios and TNCs.
Steve Dimse and I discussed my Mobile operations, and I think heagreed that
I am probably one of the most mobile APRSers (with laptop) that there are,
second to probably Peter W7LUS.  WA6RTX is mobile in his RV, but I mean
having the laptop going while driving.

At 08:04 PM 9/17/96 -0500, you wrote:
 is it because all the
>different cords get in the way and make it too much of a hassle?

This can be a problem, but I solve it by having 1 cord to my tracker/tnc
box, and the Pico-Packet and GPS out of the way, in the back.  Only cord I
```

have is 1 serial cable.

>What about a PCMCIA TNC?

Useful, and a good idea, but I see a limited market; therefore a *high* price. Also limited upgrade path unless it had a flash EPROM. Not much commercial market either as far as I can tell. Remember that a lot of the TNC Mfgrs *really* make TNCs for commercial markets, we hams are now a small business to them.

>Now, those of you with a GPS could just use the spare RS-232 port for
>that. There would be no need for special adapters that create even more

Still would have 2 cords, then VS my 1 cord. Also, wouldn't the serial card need TSR software to make it work? Possible memory conflicts w APRS.
>
>What would you like to see on an PCMCIA APRS compatible TNC? Here are a

Nice features, but have you ever used an X jack. Flimsy piece of plastic that can break off easily. One tumble off the seat and good-bye TNC! (Whether or not the laptop survived)
>
>Also I would have them ship it with an extra "NEW INDUSTRY STANDARD" plug
>to force all the radio manufacturers to install a simple jack on the

Which new plug? A new, new one or the mini-DIN one that several Mfgrs are now using already?
I do wish all the new radios had the connector, though.

>Which radio manufacturer would NOT want to conform to ease of customer
>use?

If it is used in Japan, then we may see it here, but they don't make the things *we* want. They make what sells in Japan that can be adapted for here. Just ask Yaesu why they have no 220 gear that is newer than 8 years old!

>
>I think it's time we start a letter writing campaign to the TNC

I'm not so sure.  There are a million & one different HT's on the market,
there must be quite a few HAMS buying all of these vaired radios.  If
not, why would there be so many, and more on the way.  If a company could
sell only half the number of one single model HT, it would be a success.

> Also limited upgrade path unless it had a flash EPROM.
Not every consumer bothers with upgrades.

>Nice features, but have you ever used an X jack.  Flimsy piece of
plastic that can break off easily. One tumble off >the seat and good-bye
TNC!
Valid point.  I suppose some sort of strain relief could be integrated
into the design.

>Which new plug? A new, new one or the mini-DIN one that several Mfgrs
are now using already?
Sure, that would work.

>Oh yes, we are such a *big* market. I'll bet they will be quaking!
One never knows unless they try.  This might give a DOMESTIC company a
chance.  Who ever thought there would be a market for the original TNC's,
or personal GPS's?  Heck, if people buy worthless items like Pet Rocks,
I'm sure HAMS will spend money on a useful gadget, after all they buy a
lot of junk.

TNX for the reply.

Rendered body type: text/plain

```
An interesting discussion going on about the merits of a PCMCIA TNC.

Not a new idea - I've been telling people that I'd like PacComm to do one
for several years - in conversations at such places as Digital Conferences,
TAPR meetings, etc.

Why have we not done one, then? Try to follow this logic path.

It should not be too difficult to build such a small TNC. PCMCIA 'supplies'
are readily available.

The TNC would need to be 1200 baud AFSK for amateur radio compatibility.

And above all it would have to be inexpensive (I know - we regularly get
```

berated for charging what we do for TNCs and radios - from people who have
no appreciation of the costs of running a business....)

but

To pay the development costs there needs to be a commercial market for the
product
and there would be only an insignificant commercial market for a 1200 baud
AFSK unit. (Although MARS, CAP, weather people, etc. can be a good
market...)

so

The unit would need to be switchable between 1200 AFSK and some other
speed/modulation.

but

That raises complexity and cost etc.

Enough of that to make my point.

I want to do it because it is a technical challenge, but have been trying
to avoid fun projects which cost more than they earn. This one is
borderline.

IF a good variety of 9600 baud capable portable radios existed, I'd do it
in a minute. We're locked in by the radio problem. 1200 via the mic jack.
We can do 2400 MSK via same jack, but I very much doubt that it would be
accepted as a ham standard (not same as old MFJ 2400 BPSK). We could do a
DSP scheme that could put 3-5kbps via the mic jack, but it is more
expensive and still a non-standard. Next jump is 9600 and we have the
technology for that, but not the radios.

Please keep on with the discussion. I'm looking for an excuse to do such a
project, but it has to be based on more than 'cool'.

We've just installed 5 of these little marvels in the EOC/related: APRS,
Packet LAN, my car, 2 m SSB (EOC) and 2 m FM (EOC)...they do the job!
Also available from Amateur Electronic Supply (all stores) at $62 a
piece. Also prevents third harmonic problems on UHF.

Also note, that where third order IMD is a problem, the reduction is
actually X3.

The KG5QD-3 digi at Ochopee, Florida (36 miles east of Naples)
is on the air with 50 watts omni (slight shadow to southwest, as
the antenna is side mounted on Rohn 25) at about 90 feet.
Testing over the weekend shows solid coverage from the Keys to
West Palm Beach. This is (as much as anything is) a permanent
site, and should continue to provide good service between the
lower coasts and the Keys.

The antenna is a 6 db gain dual band, (there will be a UHF network
node installed shortly), so the ERP is between 80-100 watts.

Reports welcomed! Now we start working on the folks to the north, and
a digi in the NE part of Collier County, between Naples and Lake
Okeechobee! (Possible site located!)

WB4APR COMMENT:  Just this morning I heard a fellow on 2 meters talking
about a new FCC edict that PREVENTS any local regulations that prohibit
the installation of *almost* ANY kind of "VIDEO" receive antennas!
Especially dishes below 1 meter in size.  It also permits VHF and UHF
antennas too.  SO all you have to do is show that you can receive TV on
your 2m or 70 cm antennas and you are IN!  He says this was published in
August.

Why have I not heard a thing about this in the amateur literature?
Probably because I have my head in the sand...

APRSdos REPLY/COMMENT:  9600 Baud is the only thing that makes sense.
I thought the TEKK radio worked fine at 9600?.  I would package the
XTAL controlled radio in a magmount base of a 6 inch whip antenna.
THen you only have two pieces, the MAGmount/antenna/radio and the PCMCIA
card...

In fact, forget about the scratch development of the PCMCIA TNC, and
just mass purchase PCMCIA serial cards and then put the TNC/RADIO and
ANTENNA all in the base of themag mount antenna...

Only a DC/Audio/Power cable connects the two...

   Actually, the FCC ruling is directed specifically at DSS dish antennas.
So unless you've got a DSS receiver hooked up to your 2M dish, which is
less than 1M in size, you'll have a problem.  :-)

I know this question was asked some time ago, but I wonder if the answer
has changed. Is there a way to use the Baycom tnc in a connector on aprs?
Recall that the Baycom tnc is really only a modem, with the computer
performing the tnc software in real time. The problem before is the real
time requirement vs. the needs of aprs. Thanks for any help.

Even better idea. How about somebody fairly close to the launch site
sending it out on 30m so that we can all see it right from the start.

I have the capability, but am 150 miles from the launch site and everybody
would miss the first 15,000 ft. until it got above the horizon for me.

To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.960918120041.22901B-100000@arctic>

Rendered body type: text/plain

Although on 446.0, the GPS data will be addressed via WIDE, so all you have to do is hook a UHF scanner to the input of your WIDE digipeater TNC and it will digipeat the GPS data over onto APRS 145.79! You can do this at your house too, but it will only digipeat once, so only your neighbors will see it.

Or, you can hook the 446.0 MHz receiver to your TNC input and operate your APRS station transmit side normally on VHF via WIDE,WIDE,WIDE. THen each time you want to uplink a new posit to the world around you, just hook it on the P list and hit UPLINK... This way, you are receiving the data on UHF, and then you are originating OBJECTS on your VHF side in a normal APRS manner.

But, I would watch on 2m, though, and make sure that there arent more than one of you doing this in your area, or you may see bazillions of packets..

WINDTRAX BALLOON LAUNCH Prime launch date: SAT 21-SEP-96

Flight Director: Chuck Crist, WB9IHS
Flight Sponsor: New Augusta Public Academy (5 mi NW of Indianappolis)
TIME: 1200-1300 UTC (0700-0800 AM Indy time)
Pre-Launch Freq: HF on 3870 +/- 1 kHz, local on 146.97(-) at 1130 UTC
Flight Assembly: 70-ft long consisting of balloon, parachute, crossband repeater, GPS packet & ATV equipment all contained in separate starfoam boxes and connected by 1/8 inch nylon line.
Flight Package Freqs:
Crossband repeater: Down 444.85 & 52.525 MHz FM vertical polarization @ 50 & 100 mW Pout. Up 144.3 MHz FM.
GPS Packet: Down 446.0 MHz vert pol @ 750 mW Pout [transmitting GPS "gga" string].
ATV: Down 439.25 MHz vert pol @ 1.5 W Pout. [Cable Ch 60]
Antennas: All are vertical polarization.

Max Altitude: Approximately 100,000 feet AGL.
Flight Duration: 2 1/2 - 3 hours.
Flight direction/distance: Approx E to SE of launch site & 35-50 miles.

GPS Packet by Chuck WB9IHS:
Garmin GPS rcvr, controlled by PacCom packet TNC & downlinked on Tekk 70 cm xmtr. Self-contained separate box with lithium power system. Antennas are 1/4 wave on 70 cm & strip line 1.5 GHz GPS rcvr.

4. LAUNCH SITE: New Augusta Academy, Indianapolis, IN
Lat 39.866667 N, Lon 86.233333 W
Elevation 800 ft MSL (244m)

5. CRUISING ALT: Max Altitude approx 100,000 feet

6. FORCASTED TRAJECTORY & EST CLIMB TO 60k FT:
A. 50 miles SE of launch site, while climbing to 100k ft, then descending to surface by parachute.
B. One hour to 60k ft & 90 minutes max altitude.

7. PHYSICAL DESCRIPTION: Balloon is 8 ft diameter weather balloon made by KAYMONT (same used by NWS). Entire flight assembly is 70 ft vertically in length and contains one balloon, one 6-ft parachute & three separate starfoam electronic experiment packages connected by a 1/8 inch nylon line.

8. TOTAL FLIGHT TIME: Three hours, Approx.

9. FORCASTED LANDING TIME & LOCATION:
A. 1500-1600 UTC
B. Approx 50-60 miles SE of launch site.

10. GENERAL INFO:

> Doug responded :  Use WIDE,GATE to hf so we can ALL see it.

APRSdos REPLY/COMMENT:  The balloon WILL be sending its GPS data on 446.0
via WIDE.  ANYONE with an HF gateway only needs to put a scanner on 446.0
FM and couple the audio into his TNC.  THen TEMPORARILY change his MYGATE
call to WIDE.  Then the balloon packets will be heard on HF.  On VHF you
don't even need a dual port TNC.  Any TNC can be used to DIGI the data
from a 446.0 receiver to a 145.79 transmitter... just set your MYAlias to
WIDE termporarily...

I hope you're joking.  First off, the country has only had "nationwide"
cellular coverage for about 5 years.
Unless you live in a state like Arizona where cellular is still restricted
to major cities and highway corridors.  Central (rural) AZ just got cellular
coverage due only to the fact that the Arizona Repeater Association got a
new tower on Mt. Ord and is renting space to the cellular providers.  We
have a linked autopatch up there (and have for years), and it still works
better most of the time when compared to cell phones.

Also, the Northridge (CA) earthquakes show that cellular can and does fail
when the power goes out and the towers collapse!  Ham radio operators from
Arizona showed up with "instant-up" towers within 24 hours of the disaster
and had emergency communications on-line.  Need I cite other examples?  How
about trying to dial 911 in Philadelphia or LA or Washington DC.?

>And remember it's just a hobby.

Well, that's one man's opinion.  It's a hobby, but I also know a lot of
volunteer fireman who consider firefighting a hobby...

Well, if you used that arrangement you would not even need the PCMCIA serial card. Most laptops have at least one RS-232 port anyway.

>supply requirements needed. I, too, have had a terrible time using most
>home supplies even with large 2000 ufd caps on the output of the 5 volt
>regulator. Apparently, one must turn the unit on from a stiff five
>volt supply, not necessarily turn on a supply in which a large capacitor
>needs to be charged. Can anyone confirm this?
>   Another question of interest----is the five volts on the antenna lead
>isolated to the input of the receiver at 1575 MHz? In other words, can I
>use a MMIC at the base of an antenna and expect the Garmin 20 to sort out
>the DC from the RF signal? I suspect so! Cliff Buttschardt K7RR

>From what I have seen, the GPS-20's are >>VERY<< twitchy on their +5v DC requirements. Apparently there is a processor reset threshold detector that is set too close to 5.0000v. In my "TAC Lite" (see schematic at URL ftp://aleph.gsfc.nasa.gov/GPS/totally.accurate.clock/tac-lite.zip or in the latest TAPR PSR), I found that the GPS-20 would work reliably >>ONLY<< if the supply voltage was raised to ~+5.2v. In the TAC-LITE, this was done by lifting the COMMON (i.e. tab, i.e. center pin) on a 7805 above ground with a ~27 ohm resistor. It changed the GPS-20 from being very unreliable to perfectly reliable. The new TAC-2 "universal TAC" PCB (now at the PCB house, hopefully available soon as a TAPRized kit) includes provisions for such tweaks on the board.

The +5vdc on the antenna connector is coupled with an RF choke (actually a PCB trace) to the antenna spigot. If you use an ohmmeter between the +5v pin and the antenna connector, you will find that tyhe resistance is only a few tenths of an ohm.

To use an MMIC amplifier at the antenna, here's what I do: The output lead from the MMIC feeds the coax thru a resistor shunted by a small (chip) capacitor. The standard, simple (i.e. MiniCircuits) MMICs >>MUST<< have a current limiting resistor. For an MAR-6 MMIC and +5v supply, the resistor is 100 to 120 ohms. The newer (ang higher gain) ERA-series amplifiers need a smaller resistor (don't have the value here at work, but I recall it is 30-40ish ohms). This is necessary because the output lead is a "nude" open collector on the cheap MMICs.

I believe you mail to listproc@tapr.org

```
        set aprssig mail digest
```

Early I had sent the following script. You save the digest to a file, run this script to change the file into a mail folder, then change folders.
In the scripts, I default the saved file name as 'dig' and the new mail folder as 'fold'. So I save my digest mail to a file named 'dig', execute the script 'makedig' and then change folders to 'fold'. Note that the 'fold' mail file is appended to so you could save, makedig, save, makedig ... multi times before changing to the folder fold.

```
### makedig ### Keven Miller KC7LYD ###
file=$1
newfile=$2

if [ -z "$file" ]; then
        file="dig"
fi
if [ -z "$newfile" ]; then
        newfile="fold"
fi

sed -f ~/mail/seddig $file >>$newfile
rm $file

### EOF ###
```

Here is the sed script file used in the above unix script

```
### seddig ### Keven Miller KC7LYD ###
# Listserv digest mail splitter
# Keven Miller  kevenm@valtek.com  02-APR-96
#
# Minium header to hold and paste is 1st line "From ..."

Rendered body type: text/plain

Hi Tom and the group. Wonderful reply to my questions! Yes, I found that the Garmin supply had to be slightly higher than 5 volts but by experimentation rather than anything concrete. I will do the 27 ohm resistor trick and confirm your results although it certainly will work. At least knowing some of the theory helps a great deal. Same on the RF choke in the antenna lead. I have a quadrafiler built up in a stainless pet feeding bowl working just fine but the addition of MAR 6 will help.

Congratulations on your material in the PSR! I am looking forward to the board when TAPR gets it done. Again it was useful knowing the limitations of the Garmin unit vs the Motorola unit by reading the PSR.

There is quite a bit of info on the FCC's web page, so you can get it all from the horse's mouth. The Report and Order and a Further Notice of Proposed Rulemaking can be found in

http://www.fcc.gov/Bureaus/International/Orders/fcc96078.txt

If you browse their site further, you will undoubtedly find other related information.

Reply to: RE>Apartment antennas!

One can read more about the recent FCC ruling at the Ham Radio Online web site (http://hamradio-online.com/1996/aug/fccanten.html).

They recently wrote: "FCC Ruling Prohibits Unreasonable Restrictions on TV Antennas by Ham Radio Online, 7 August 1996. In a major ruling, the FCC declared void local laws prohibiting or restricting the use of small wireless dish antennas. More significantly, the FCC declared that use of small dish antennas and television receiving antennas can not be restricted by "any private covenant, homeowners' association rule or similar restriction on property within the exclusive use or control of the antenna user". Under the federal pre-emption, all homeowners must be allowed to install TV antennas."

WB4APR COMMENT: Just this morning I heard a fellow on 2 meters talking about a new FCC edict that PREVENTS any local regulations that prohibit the installation of *almost* ANY kind of "VIDEO" receive antennas! Especially dishes below 1 meter in size. It also permits VHF and UHF antennas too. SO all you have to do is show that you can receive TV on your 2m or 70 cm antennas and you are IN! He says this was published in August.

Why have I not heard a thing about this in the amateur literature? Probably because I have my head in the sand...

Cliff, I use a Trimble active antenna with my GPS-20 and it works very well.

I agree about a stiff supply. I used a 12 volt 3 AmpHour battery for my GPS-20. This supply was not always stiff enough. The 2200 uF capacitor did the job for me.

Sam

On Tue, 17 Sep 1996, Clifford Buttschardt wrote:

> There have been a number of comments regarding the Garmin 20 and the power supply requirements needed. I, too, have had a terrible time using most home supplies even with large 2000 ufd caps on the output of the 5 volt regulator. Apparently, one must turn the unit on from a stiff five volt supply, not necessarily turn on a supply in which a large capacitor needs to be charged. Can anyone confirm this?
> Another question of interest----is the five volts on the antenna lead isolated to the input of the receiver at 1575 MHz? In other words, can I use a MMIC at the base of an antenna and expect the Garmin 20 to sort out the DC from the RF signal? I suspect so! Cliff Buttschardt K7RR

I understand that there is a PCMCIA card which will add two (2) serial ports to a computer (laptop). With all the conversation going on now, on the SIG, about PCMCIA cards. Does any one know where I can get a dual port PCMCIA card. I understand that a company named Pocket (sp?) makes one but I have been unable to find out any information on them.

In advance, thanks for the help. This should make mobile APRS with GPS and Wx much easier.

>for such a device. Think about it for a

I work for a company that manufactures PCMCIA modems, ISDN Terminal Adaptors, as well as a few other things. I am sure it could be done but the demand many not be high enough for manufacturers to design, develop and market such a device. I was thinking about the concept recently myself and I am sure there would be buyers but the amateur market is relatively small.

>I think it's time we start a letter writing campaign to the TNC
>manufacturers. Tell them what we want!

Now that is a good idea.

>Whoever comes out with one will sure sell a heck of a lot more of them
>than the radio people with hundreds of different models to choose from!

Exactly. We are the only company with a PCMCIA TA (actually it doubles as a 28.8 modem too for the times one cannot get access to an ISDN line) on the market right now and I am sure whomever would be first to release such a device would take the market by storm.

It might have to be farmed out to one of the PCMCIA manufactures though.

> with APRS? I would like to hear the opinions of those who have and use
> one.
>
> Thanks!

Well Robert that's a big question Hi. Is it reliable, that remains to be seen it's not been on the market all that long. Does it work YES it does a great job and never failed to point right to the signal. Could it be better, of course it could. There are some features that should have been though out a little better in my opinion, but then again when you use of the shelf parts you don't have to much choice as to design. I don't care for the way the cables enter the DFjr since the spacing for the 3 connectors isn't enough, this eventually will cause problems. The tactile buttons suppose to require very little pressure to make, but i found the two outher once to require more then they should because they are located to close to the edge of the case , and of course this is due to them using a off the shelf case that realy is to small for the components. There are several other things that could be improved, but don't look for them to happen anytime soon. The antenna switching unit was suppose to have been potted to waterproof the unit, this wasn't done and the reason for this was that they had problems with a number of switchers and of course potting them would make it nearly impossible to repair them. Agrelo is very good as far as standing behind their products as far as i have heard. I did ask if the switcher would be covered under warranty if it blew because of water entering the unsealed coax leads running into the switcher, i never got an answer to that question instead i was told to use a hot gluegun to seal the coax. Instead of using Hotglue (Don't like the stuff) i build a radome over the antenna swichbox that actually serves another purpose. It hold the 4 antennas at the right spacing (90 Degree apart). The reason i did this was due to the x brace only having one bolt in the center (With a compression pin) to hold the x brace in place, and i found that after several installations and removals from my pickup that the antenna's where not 90 degrees apart anymore, this is another mechanical design flaw in my humble opinion. But what piece of equipment have you ever bought that was perfect in everyway, i haven't found any yet.

All in all i like the DFjr and it does the job it was designed to do. I have had many messages from those that do have the unit and all rave about it's performance. Would i buy one again YES i would. Is it easy to use, well that depends what you call easy maybe hard to the next guy, i haven't had any problems using it and for me that's great because i'm one of those people that try before reading the instructions (What instructions) Hi. By the way be carefull on what receiver you use with it. I started out by using a Rat Shack 2022 scanner and upon a long installation project found it doesn't work with the DFjr because all i could hear in the speaker was the DFjr processor. I now use it with my Yaesu FT5100 and that works great. Joe probibly will hate me for writing this, but o well i tell it as i see it and some people can't deal with that i guess. This is my opinion on the DFjr like it or not, besides you asked Hi.

What kind of TNC is that ? I have never heard of a TNC that is accurate to a
hertz or so. What I mean is that I have never known that it matters what
quality of TNC you have when it comes to RF frequency. I have always thought
that is a factor of the radio not TNC.

593. HF Paths

From: n2czf@magg.net (Richard Garcia)
Date: Wed, 18 Sep 1996 02:32:55 -0400
To: aprssig@tapr.org
Message-ID: <199609190233.WAA15447@grumpy.magg.net>
Rendered body type: text/plain

I have seen several messages on HF and been lurcking in the background
looking at UNPROTO paths myself. It is a very simple process to follow.

RELAY and WIDE are a ALIAS only viable on VHF circuits
ECHO is a vaild ALIAS on HF Circuits but has never been encouraged

Now there MAY BE some stations on HF with something other than ECHO but this is NOT THE SUGGESTED STANDARD! I personally have removed ECHO from my HF alias, at one time too many people were using ECHO for no good reason, anyone can still digi via a SPECIFIC callsign even if there is no generic alias and DIGI is set to ON. Now the people who really need ECHO (just a few mobiles) will only digipeat via a few other dozen HF stations but at least I am not adding to the problem. If someone needs my specific location as a digi then they can enter my callsign in the path and still use it. The use of a specific callsign is the appropriate way of digipeating on HF if and only if needed.

If you have set your ALIAS to RELAY or WIDE on HF please do not, it is not the standard and adds to the chaos that can come about very easy on HF. If anything set it to ECHO or some unknown ALIAS so others are encouraged to use specific paths. The idea of ECHO use in special situations is a good one but it has been abused in the past.

FIRST ANNOUNCEMENT

TAWG FALL APRS CONFERENCE 96
October 26, 1996
Columbus, Ohio

Bringing together a contingent of APRS technologists to discuss recent progress within the tri-state (Ohio, Indiana, & Kentucky) area and the direction for the future.

Everyone with an interest in APRS is invited.

The Columbus, Ohio site was chosen to be a central location for attendance for hams in Pennsylvania, West Virginia, Northern Ohio, and many of the TAWG members.

Topics to be addressed include:
- Recent APRS network achievements as well as future challenges.
- Committees to promote APRS activities.
- APRS interface with the National Weather Service.
- Question & answer session for newcomers.
- Other activities to be announced.

SPECIAL EVENTS
- A GPS Video (Approximately 20 minutes).
- A demonstration and progress report on ERIC (Electronic Roadway Information Companion). ERIC monitors data from your GPS and through an internal synthesized voice guides you along the way. ERIC adds speech to your GPS. Innovation at work.

LOCATION:
Whetstone Branch
Columbus Metropolitan Library
3909 N. High Street
(Near the entrance to the Park of Roses.)
Columbus, Ohio
Destination Waypoint - 40-02.47N 083-01.19W

DATE/TIME   October 26, 1996 1030 - 1500 local

TALK-IN: 147.17+ Repeater

SPONSOR: Tri-State APRS Working Group (TAWG)

All are encouraged to attend. For further information contact:

Sid, AA8JK
e-mail: AA8JK@aol.com
Packet: AA8JK@n8jsf.oh
Phone: 937.866.3911 (New Area Code)

Unfortunately, I don't often hear Peter direct. If N0AN, KU0G, or KF0ZH can hear him and sero beat, those of us west of the Rockies can probably get back on the dead center of the net.

> :even though they really only have GATE, WIDE in their unproto>
(snip)
I happened to see this exchange, and seems to verify my suspicion that
our local WIDE is ADDING things when digipeating HF to VHF.

This is the same station that constantly beacons "stats" (what 'port' is
on what freq...how many accesses to each port, and so on) these "stats"
change constantly (the usage part) and virtually everytime I touch a key
I get the message for a NEW BEACON.

Is the capiblilty to add (WIDE's) to an Unproto path within APRS? or is
it something he does with his tnc?

writes:

>WHAT IS THE SIMPLE WAY TO BUILD A MINIMUM SYSTEM ON A 1.44 MEG DISK
First format a BLANK disk with the /s attribute to make it bootable.
(i.e. FORMAT A: /S)
Add  config.sys & command.com, tailor to your needs.
(To load your programs and bypass the time & date garbage)

If you want APRS compliant protocols in a comm program try HAMlet, it's a
simple and small program that
with a simple editor will be under 50K in size.  This will give you
PLENTY of room left for downloading or logging files.  The drawback to
HAMlet is..... you cannot clear the screen.

If you want maps, APRS7.7B will fit on the disk, especially if you do not
use all the extra maps.

For a plain (NON APRS) packet program I strongly suggest PAX 3.20.  It's
a 12K TSR, but it's > GREAT <.

You do not need anything fancy to relay APRS or to send your coordinates.
 Although dumb systems cannot
be polled with the ?APRS? command.

601. More GPS-20 followup

From: "Tom Clark (W3IWI)" <clark@tomcat.gsfc.nasa.gov>
Date: Thu, 19 Sep 1996 04:24:25 +0100
To: aprssig@tapr.org
Cc: wd5ivd@tapr.org
Message-ID: <3240BCE8.305E@tomcat.gsfc.nasa.gov>

Rendered body type: text/plain

I was asked in a non-SIG message to describe the symptoms when the GPS-20 failed to start because of inadequate power supply voltage. What I saw on my first GPS-20 (one of the initial batch that APR bought) was that there was no RS232 NMEA message output and the current drain was abnormally low until a threshold of ~5.1x volts was hit. Then the receiver started sending data and the current drain went up to the expected value. I presume that the increase in current was because the -20's 80188 CPU started working. I tried using the discrete reset pin to force it to start in the low-voltage state with no success. As I reported, my "fix" in the TAC-LITE was to use a supply voltage ~5.2v and it worked fine. The GPS-20 specs say "5V +/- 5%", so all I was doing was to run it near the upper end of the "official" specifications.

Recently I got another GPS-20 from TAPR for the new TAC-2 development effort and tonite I made up the cables to see how it performed. My test jig is precisely that I documented earlier in the PostScript schematic in the file at URL

  ftp://aleph.gsfc.nasa.gov/GPS/totally.accurate.clock/emulate.zip

except that I omitted the 7805 regulator and use a variable bench supply.
The second GPS-20 seems to start just fine at ~4.8v and shows none of the "sluggish" performance of my earlier experiences. Based on this universe of two statistical sample, all I can say is that some GPS-20s are sluggish and some are not. My recommendation remains the same -- since SOME are sluggish, it seems prudent to run with ~5.2v power.

In testing both GPS-20s I always see that the lockup is a bit bizzare. The receiver will be tracking 4-6 satellites, then for a few seconds it goes crazy, reporting zero or 1 satellite, and then it relocks. It does this "dance" several times and then settles down for a while. This is in contrast to the Motorola ONCORE, where once a satellite is locked, it stays in lock (except during QSB fades when the signal is weak). I can only presume this is because the GPS-20 is only a 2 channel sequential sampling receiver which scans the available satellites, while the Motorola has independent parallel correlators (6 or 8) and each satellite is viewed full-time. The more complex receiver is more robust, but it costs ~2x as much!

Since the GPS-20 "dances", and because it is slow to lock up, I recommend that users include a "mini-UPS" to buffer against power glitch induced resets. In the TAC-LITE I did this with a 9v NiCd battery that can run the receiver for 5-10 miinutes, as seen in the schematic at URL

  ftp://aleph.gsfc.nasa.gov/GPS/totally.accurate.clock/tac-lite.zip

I did include all the necessary diodes and room for the current-limiting charging resistor in the TAC-2 board that I hope we will be able to announce RSN (Real! Soon! Now!) as a TAPR kit.

Also on aleph (and some of the data is in the latest PSR), are plots of the timing performance of the GPS-20. We found that the 1PPS pulse is about 2 usec EARLY to the UTC second on my first GPS-20 (in the TAC-LITE).
A quick test of the timing on the second GPS-20 that I just powered up tonite shows a similar ~2 usec bias, so my "universe of two" statistical sample shows that the 2 usec bias is generic to the GPS-20.

For those of you with GPS-20s, you might want to try my SHOWTIME clock display program. You do have to add one wire to the RS232 cable to send the 1PPS signal to the DCD handshaking pin on your PC (as shown in the emulate.zip schematic). SHOWTIME will give you the "perfect" clock you have always wanted to have in your shack. To fetch SHOWTIME, do the following:

(1) ftp to aleph at URL

      ftp://aleph.gsfc.nasa.gov/GPS/totally.accurate.clock/distribution/

```
(2) Type "binary" to enable binary file transfer

(3) fetch the most recent big distribution archive with

      get showtime.v331.zip temp.zip  (or whatever the file is named)

(4) Unzip the temp.zip file with the -d option to a floppy:

      pkunzip -d temp a:\

(5) Either do a full setup or update with

      C:\>  a:
      A:\>  setup c:

(6) There is a later update to SHOWTIME you might want to get, so also
    fetch  shwtm332.zip  if you want it. Unzipping this will produce
    a file shwtm332.exe which you should put in c:\tac\bin and rename
    to be showtime.exe if you want the latest in the ongoing evolution
    of this software.

 I bought a single port PCMCIA serial card for about $120 from a mail order
company. Check any mail order catalog. I have Insight, CDW, and Datacomm.
Try www.insight.com or www.cdw.com on the web.
  Hope this helps. It fixed my single port problem. I dont much like the
PCMCIA connector though. too flimsy.

I am copying W1ON-3 in Lynn Haven FL today Sept 18...this is the first
time I have seen this station. On the Digi list this is his beacon:

W1ON-3 >APRS, W7LUS, GATE, WIDE, WIDE*

I also copied NWSPTC TEMP STATION IN FAYETTEVILLE
When I hooked the station it showed a callsign KB4KZY-2

Also GHCC no ID was just next to KE4ROC

Nice band opening today in the South East US!

I just posted INAPOLIS.ZIP which is an improved indianapolis 32 mile map
which adds rivers and streams and county lines to the existing
INAPOLIS.map.

But, while posting, I notice that someone else has posted INMAPS06.zip
which probably has much better maps anyway...

It was me. I added four-mile maps for Indianapolis. A thirty-two mile map will be great.

>KC7CO

I am all for us getting on one frequency, but let's try to do it right.
Are we talking about zeroing to Peter's digi, or his mobile? Somehow it
concerns me that we would be using a mobile station as the standard.
Further, the problem is not necessarily the tones of the tnc being on,
(which is important), but the RADIO has to be on frequency as well, and in
the varying temperature situations that mobile stations face, not to
mention warm-up and cool-down issues, I wonder what we are talking about
here.

I will be happy to comply with whatever we settle on, but let's think
about this a little first. I know I am being heard very well throughout
the USA, so I could serve as a "secondary" gathering point and am willing
to do so.

Since the issue is stability and not absolute accuracy, we want to make
sure that whoever is used as a standard either has a high stability TCXO
radio, or virtually NEVER turns their radio off. With most modern radios
(though  not all), if they are left on they are rock solid. I am using a
TS-870s which seems to fall into this category, but I have owned other
modern radios that drifted significantly after a few transmissions.

APRSdos REPLY/COMMENT: Remember the plan proposed in my docs.  The czar
sets his MYAlias to TUNE, other 2ndary czars set their aliases to TUNE1,
TUNE2 and so forth.  THen anyone on freq can just set their path to  TUNE
and ping a few times to see where the freq is.

This was a general idea for newcommers to a HF freq.  It is not so
important on 10151, the only APRS freq (so far, hi hi) because there, we
can all reemember the czar by callsign.

If someone wants to do me a favor, they could check W3ADO agains W7LUS and
lemme know if we have drifted apart...

Getting on the proper freq is a good idea, but make sure it is the correct
freq. That is actually very simple to do, especially on 30m. Here's how I
do it on the 30m band.
```

Dial up the 10Mhz WWV. Zero beat it by ear. Connect an oscilloscope to your reciver audio. With the Trigger on the oscilloscope set to LINE, tune your radio until the trace stands still, with a period of about 16.7 ms. Its the getting the trace to stand still that is the important part here. Now you are exactly 60 off of 10,000,000 Hz plus or minus the accuracy of the 60hz coming into your house, which is about +/- 2Hz. Read your dial, and determine your dials error. (I have not found a radio yet that is not off freq. by at least 10hz using this method).

Then go park yourself on the correct freq. and let other people who are not on the correct freq. miss the traffic.

Good point! I seem to recall reports from HAMs that worked the OKC bombing and the Ft. Smith, Arkansas tornado that cellular provided excellent communication. Excellent communication, that is, to those first few members of the press that were able to get a trunk and camp on it. That and the fact that cellular is still basically land lines with portable handsets is why the Red Cross has already recognized the virtual uselessness of cellular in major emergencies (and many no so major emergencies).

...Anyway, I keep MY spare set of cellular batteries charged just in case. :*)

Granted, but don't forget that the larger cellular providers have `Cellular On Trailer Systems' (COTS). They use them primarily for large events such as the Super Bowl and the Olympics, but I guarantee you that they are justified at least in part as being able to provide cellular service ASAP if the disaster knocks out normal service. This, of course assumes that land lines (not to mention power) are available.

Hi all,
    I've been acutely aware of the importance of the unproto command since
I first started using Mac APRS. It occurrs to me that every APRS station
has a computer (unless Digi's don't in which case my thought is
irrelevent). Anyway a computer can do rather complex things. Couldn't a
computer examine each station's path and either correct it or refuse it if
it doesn't conform to some standard? This would prevent most "bad" paths
from doing damage. Just a thought.

John Lakeland kc6vlr

>From local observation, I think that W1ON-3 is changing the paths of
stations gatewaying through him by adding 1 WIDE to whatever the originating
station sends. Initially, I think it was being done so that all of the HF
stations would be heard by the local WIDE and Digipeated. I get the
impression, based on the "nice" status messages it send out, it is a
homebrew program doing the path modifications. Clearly APRS won't do that.

 The Sysop of the station is Doc, W1EO. Does anybody know his email address?
Maybe some local in the Boston area can drop him a message next time W1EO
shows up on the screen? I will if I see him!

APRSdos REPLY/COMMENT: No. All routing of APRS packets is done by TNC's. The PC or Mac has nothing to do with it... I dont want to hard limit anyone's choice of path when they enter it either, because some paths which are "BAD" most of the time are sometimes good under some unique circumstances...

>Here's how I do it on the 30m band.

The amount of absolute frequency error is much less a problem than the amount of offset error. Offset error causes the packets to be non-decodable, absolute error (only if severe enough), merely gets you a qsl card from the fcc).

Getting everyone on the same frequency seems to me to be a lot more important than getting everyone on the "right" frequency. My experience during my tenure on 14.109 (13 years worth), pretty well established that most modern radios were "tolerably close" to the frequency they displayed (in order to stay in band and not interfere with other established nets), but that the operator tuning to frequency was just short of awful without someone taking the time to "round guys up" and get them back on frequency.

Just from my own experience, I have much more confidence in zeroing to a polar station or czar who is:

1. active
2. accessible
3. strong

than I do in 50 to 100 people trying to reliably repeat a set of instructions for putting their radio on frequency based on wwv and a scope. Call me pessimistic, but I think the suggestion made, while having technical merit, is unlikely to produce the results we are looking for. Not everyone on the net has a scope, in fact, I bet only a minority have one.

Further, it doesn't matter whether your dial is "right-on" or not, if your radio drifts, or you turn it off and on....the problem re-surfaces at square one.

The only way to "effectively" keep from spreading is to have polar stations that are active, accessible and strong to zero against, and for feedback to be provided to those who are straying. That is what we ended up having to do on 14.109 and it worked. Until we did that, nothing worked and we ended up with discussions of whose radio was more accurate than some one elses, who knew how to calibrate best, etc. ad nauseum.

Let's figure out who is "supposed" to be the polar station(s), whether they meet some minimal criteria and then help keep each other on frequency by ....gee....communicating...whoa, what a concept.

IMHO, the criteria for being a polar or czar (too authoritarian for my tastes), station would include:

1. On the air, 24 hours per day, 7 days per week.
2. Located so they could be heard by the greatest number of current/potential net members.
3. Strong and Stable with a properly calibrated TNC

```
4. Accessible: be on this list, or at least have an email address THAT
THEY
   REGULARLY CHECK, so the vagaries of propagation and keyboard to
keyboard
   chatting could be avoided.

Once this gets worked out, I think Bob's suggestion that he refers to in
the  DOCs to his program about an alias of TUNE for the primary polar
station and TUNE1, TUNE2 for secondary polar stations would be a GREAT
idea.

What do you guys think?

BTW: I ain't volunteering or advocating for anyone to be these polar
stations,
       nor would I refuse to help. My concern is to have someone to sit on
       that I can hear, who is reliable and can be contacted and conversed
       with easily, i.e., responsive. Since the list is here, it might be
a
       good starting point for conversation.

618. DGPS Tests in Balto/Wash Area

From: clark@tomcat.gsfc.nasa.gov (Tom Clark -- W3IWI)
Date: Thu, 19 Sep 96 18:16:05 UTC
To: aprssig@tapr.org
Message-ID: <106661@tomcat.gsfc.nasa.gov>
Rendered body type: text/plain

```
This message is to inform the APRSers in the Balto/Wash area that I'm
planning on re-instituting the W3IWI-13 high accuracy DGPS beacon on
145.79 RSN (Real! Soon! Now! -- like maybe by this weekend). If you have
any problems with the plans outlined below, speak up now.

First, let's define DGPS. Your small GPS receiver works by obtaining
the time (for position) and frequency (for velocity) data on several
(at least 4 for a 3-D position) GPS satellites. The timing is measured
with a precision ~100 nsec and the frequency with a precision ~ 0.1 Hz
relative to the clock oscillator in your GPS receiver. To get a 3-D
position/velocity you need to observe a 4th satellite to "set" the
receiver's clock and determine its frequency offset. The timing
measurements are usually expressed in distance units and are called
pseudo ranges (PR); the frequency data is often called pseudorange rate
(PRR) or apparent Doppler offset.

Your receiver munches on the PR/PRR data based on data transmitted by the
GPS satellites (at 50 bits/s, in 1500 bit messages sent once/30 sec,
which include high accuracy Keplerian elements, time tags, information
```

on the offset and rate of the GPS satellite's atomic clock, etc.) to produce the position/velocity estimate. The accuracy of the estimate is limited by several factors:

a. Inaccuracies in the broadcast Keplerian elements
b. Inaccuracies in the broadcast clock models
c. Delays that the signals experience passing thru the ionosphere and troposphere
d. RF Multipath at the receiver
e. Inaccuracies & noise within your receiver
f. Dilution of Precision because the spacecraft-to-observer geometry is imperfect and changes with time.

Items (a) and (b) arise in part because they depend on measurements made on the ground with instruments that have all the errors, in part because the physical models don't account for everything (like the Keplerian elements not fully accounting for all the Relativistic corrections, solar radiation pressure on the satellite, inaccuracies in the gravity model, etc). Such errors can amount to a few meters in position.

The most serious (a)+(b) error is that the DoD intentionally degrades the spacecraft's atomic clock performance and may not send the "world's best" Keplerian elements under the policy known as Selective Availability (SA). The most significant SA error is the dithering of the clocks, which results users seeing their position wandering around by up to 100 meters and speed error of 1-2 km/sec even when fixed.

The concept of DGPS attempts to fix several of these errors by doing the following:

1. A high-quality receiver is set up at a permanent site and its position is established accurate to a few cm.
2. This receiver only uses the visible GPS satellites to solve for clock errors and assumes its position is know perfectly.
3. The PR and PRR errors resulting from these assumptions are then broadcast on a separate radio link a few times per minute.

The accepted format for the DGPS data is specified in documentation published by the Radio Technical Committee, Maritime (RTCM) and RTCA (A=aircraft). The common format is officially named RTCM SC-104, but is usually just called RTCM. The data bits are a binary string encoded similarly to the GPS 50b/s downlink with 30-bit words (24 data bits, 6 error correction bits).

RTCM SC-104 data is now routinely transmitted as GMSK data (usually 100 or 200 b/sec) by the Coast Guard in the 280-320 kHz range from sites every few hundred km along the US coast and inland waterways. DGPS data is commercially available transmitted on subcarriers on FM broadcast stations.

These DGPS signals do more than just remove the effects of SA. Since the receiver that generates the correction data is using the same algorithms and data as the user to perform the orbital dynamics calculations, small errors in the ephemeris cancel out, as do errors in the clock models.

If the DGPS site is within ~50 km of you, the atmospheric corrections are similar at both ends.Hence the effects of the errors (a)+(b)+(c) are to a large extent canceled. In controlled zero-baseline tests (both the DGPS generator receiver and the test receiver operating from the same antenna, hopefully producing a known answer), I have seen sub-meter performance from the Motorola ONCORE receivers and at levels of a few meters from a Garmin GPS-45 with PR/PRR correction messages arriving every 20 seconds.

About 2 years ago, I put the W3IWI-13 DGPS beacon on the air on 145.79 and it operated for several months. The commercial receiver I was using to generate DGPS bits was needed elsewhere, the radio blew up and the antenna came down in an ice storm. I'm about ready to re-institute the service. Here is the setup:

- Site: The Goddard Geophysical & Astronomical Observatory (GGAO) near the intersection of Powder Mill Rd & The B-W Parkway. At GGAO, my group operates the GODE permanent GPS site for the International GPS Service for Geodynamics (IGS). The GODE antenna position is know at the mm-level with respect to the ITRF (International Terrestrial Reference Frame), and the antenna has an multi-port RF power splitter.
- GPS: The RTCM SC-104 signals are generated by a Trimble 4000SSE Geodetic receiver operating from the GODE antenna. The receiver's clock is derived from an external Hydrogen Maser atomic standard, accurate and stable at levels of ~1:10e14. The 4000SSE generates RTCM SC-104 bits at 4800 b/s and is set to a message rate of 20 seconds.

(the above widgets and facilities are clearly non-amateur! The amateur
interface is an RS232 connector at 4800 b/sec).

  - Amateur: Conventional packet station (TNC2, IC-27 radio, ~8db gain
    collinear antenna on 30' tower).

When I had W3IWI-13 on last time, I sent DGPS data once/30 sec, digipeating
thru WB4APR-1. The 30 second rate proved a bit too slow and the APR-1 link
was too marginal, so my plans are to use a 20 sec rate with no digipeaters
this time (also, APR-1 is off the air now). The coverage area should be
30-50 km radius, including Baltimore, Washington & Annapolis. The DGPS
data will be <UI> frames addressed W3IWI-13>DGPS. The RTCM SC-104 station
ID is 0073 (decimal).

As you monitor the UNPROTO frames, the RTCM data will appear as a random
string of text characters. When the 30-bit words are transmitted in pseudo-
ASCII, 6-bit nibbles are padded to 8 bits and all the resulting characters
are non-user-hostile (I hesitate to say user friendly since they are
gibberish hieroglyphics!) in that they are all printable (your screen won't
clear at random times and there should be no bells!).

So I ask the Balto/Wash APRSers if there are any objections to this added
145.79 QRM. Bob (APR) suggested that I kludge up a smart controller so that
users can turn the DGPS beacon on/off remotely, but this isn't in the cards
for right now for 2 reasons: (1)I haven't time to kludge the controller, and
(2) I want to be able to have totally passive (i.e. receive only) stations
make use of the data for some experiments I'm planning.

You can use the W3IWI-13 DGPS data by just plugging your TNC into your GPS
receiver and enabling RTCM (most GPS receivers expect 4800 baud data). In my
earlier tests, I was able to get performance of a few meters at my home QTH
about 25 km from the GGAO/GODE site. When DGPS is running, you will find
that your "I'm stopped but the $*%$#@& GPS still says I'm moving 2.3 MPH"
problems will disappear. We haven't tested it for a long time, but APRS
software used to support DGPS data just fine, passing <UI> frames addressed
to DGPS on to the GPS receiver [Bob -- do you predict it will STILL work??].
You'll know its alive when you see IWI-13 beacons. Please send me reports,
especially if you are able to make use of the DGPS data.

Actually the 60Hz is alot closer than +-2 Hz. Generally +-0.25
unless of course you are running from your generator or not connected
to the grid.

620. GPS via Windows caution!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Thu, 19 Sep 1996 14:53:13 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.960919133448.17869D-100000@arctic>
Rendered body type: text/plain

```
I have had a BIG roof top stand alone tracker since 93.  But, I only tape
it to the roof for major trips or rare special events.  All the rest of
the time it sits on my BIG 3 foot by 4 foot dashboard under the largest
sloping windshield in america, the Pontiac Transport (Chevy Lumina, or
Olds Silohette)...

Now remember our trip to Dayton, when Will's GPS-45 would NOT work on
my dashboard, we speculated EMI from my crudely built original tracker
right next to it plus two laptops and 3 radios...  and left it at that...

Well today I did some specific GPS-45 testing with only the MIC in the
car and could not even get a fix.  Finally held the GPS-45 out the drivers
windows and got 8 satellites FULLSCALE!.  Bring it in on the dash, ALL
satellites go to ZERO!  Remember this is the worlds largest windshield
area! and very sloping...

Conclusions.  The full size magellan egg shell antenna on my stand alone
tracker has always worked on the dashboard (tho I have suspected it was
less than perfect)  The GPS-45 does not.  THe Van has heavy tinted windows
all around, but the WINDSHIELD is not tinted...  Anyway, it appears that
the glass in that window has 15 dB or more of attenuation!

This is a shock to me, since I had planned on using the MIC Encoder with
the GPS only on the dash.  Turns out my other cars have *NO* problem with
the GPS-45 on the dash...  and their windows are much smaller and more
straight up...  So  All windows are not created equal!

Actually, it would not be too dificult to run a TNC in KISS mode, and
have the computer play with the forwarding. I have thought about doing
something like this, but never got around to working on it. May that is
what W1EO is doing.

When I look at many of those vans, it appears that the wind"shields" have some
metallized coating. They have a gold tint to them. Polarized sunglasses
really show it.

You shouldn't be so surprised. The really DARK tinting (quite popular in
this area among the Drug Barons!) is applied as an aftermarket film on
the windows. The "opaque but reflective" coating is chrome vapor deposited
on mylar. What are wire-wound resistors made of? niCHROME wire.

Both WA7CJO and I have used the "drug baron" window covering as microwave
absorbing material, like to tame down amplifiers that wanted to oscillate.
If you have a scrap of the material available, you can test its absorption
properties by sticking it in a microwave oven. If it gets hot, it absorbs.
In the case of the "drug baron" material, the microwave oven test proved
to be a flame test, with the material igniting after a couple of seconds!

So Bob, the basic answer is that you were trying to see GPS thru a thin
film of nichrome wire! The results don't surprise me a bit.

Yes it is; it may not be as deeply tinted (i.e. dark color) as your side
or even rear window but it is tinted. Can you see a little blue shaded
area at the top? That's the giveaway. Nowadays you almost CANNOT buy a
car in the US that does NOT have at least the basic tint from the
factory, especially if you order airconditioning in your car. Again, the
blue strip at the top of the windshield is the giveaway that you have
tinted windows.

you all must know that ALL has missed the point ../.
1- the carrire freq. is what YOU are responsible for ,.. if your rig
messes up and you tx in a band that your ticket/license is not good
for.. oh well ..that in on you..

2- who is on freq.?????????/ DON'T THINK THE OTHER GUY IS HE THAS THE
SAME PROBLEM AS YOU   ....

3- read part 97   that is your responsibility ,DON'T be miss guided ..

4- i know the FLAME"S are comming BUT befor you do PLEASE get your
updated coppy of THE RULES   PART 97   IF you don't
have them then don't say any thing .

have fun with THE " ART" and help ..

I'll be out on the bay this weekend listening with my Traxar. (The
sailboat is my real  hobby; cause it consumes more money.) A couple of
years ago when you did DGPS I naturally had no trouble copying the digi
from WB4APR-1 on the massive tower in Annapolis harbor. This time it may
be a little more dicey trying to copy the small tower at Goddard, but  I'll
give it
a try.

We have a Chevy Lumina.  I found that my radar detector was quite deaf when
looking out the front window.  Months later, I noticed when I was standing
in front of the van there was a golden tint on the on the front window.  I
believe that they must have a very thin film of metal in the glass to
reflect some of the solar energy to cut down the greenhouse effect within
the vehicle.  I think that is why you are not receiving the GPS signal.
Since the van is fiberglass, it makes it hard to mount an antenna on the
body, since magnets won't work!

I just purchased a Trimble Antenna from PacComm at the Melbourne FL hamfest. All I can say is WOW! With the antenna on the dashboard I can get 4out of 8 Sats all the time, the impressive part is that this is with a METALIC Sunshield on the window!! I am never satisfied with "it works", if this was not impressive enough I then took the antenna and placed it on the only metal surface of my truck (89' Full Size Blazer). The only metal is located in the LOWER half of the dashboard near the glovebox and with the sunshield up I was still copying 4 out of 8 Sats! Note that the Blazer has heavy metalic tint on all rear glass and I have added more tint to the front windows due to the Florida sun.

Needless to say the antenna when on the dash with the shield down or taped to the front of my rearview mirror receives 8 out of 8 Sats most of the time. This is one great antenna and I am sure glad that I am not having any of the problems below. BTW the antenna works very well with the Garmin GPS-50, I have had no problems supplying current to it from the GPS. To tell you the truth I am not even sure if it is active or not but it works for me so I really do not care too much. Hey Gwen, is that thing active ? It sure acts like it is!

I ordered a GPS-20 engine from TAPR right after Dayton. Got it a couple of
weeks later. I could not get it to send a full line of data. Tried all the
smoothing caps. and such. Tried my GARMIN 45 antenna. Finally Bob said to
send it back to TAPR for another one.

I did, just got it to work. Only took me 3 months! Anyway it dumps data
fine to Precision Mapping 1.1GPS. More important, it is working right with
the PICO TNC w/2nd serial port. Even works right with WINaprs.

Also my DFjr works great... BUT only in standalone mode. I still cannot get
it to work with the GPS/TNC/winaprs.

I went and looked at the winAPRS web site. The front end is still dated mid
SEP 95, announcing the coming release at Dayton.

Maybe by next Dayton they will get HSP working.

Thought I saw, or read, or was told that the DFjr WORKS with winaprs, GPS,
TNC with the DFjr "mulitport adapter"... guess I was just dreaming.

Now if BOB can get the digi's back up so those of us in Northern Virgina
can see the rest of the right coast.

Anyone going to the Virgina Beach Ham fest this Sat.?

hope springs eternal..

Kent

Hi Kent,

Right now all three only work with DOS & MAC APRS, WinAPRS has it implemented
but not running because of the HSP not working yet. I'm sure the Sprouls
are working on it and are very close.

At the company where I work, we use a lot of Motorola microprocessors.
The "should" work 4.90 to 5.10 volts as I remember.
If the supply gets down to 5.02 volts the micro goes out into left field.
We also have to keep the +5 volt supply elevated to at least 5.1 volts for
reliable operation.

Greetings from Red Lodge, Montana. (60 miles NE of Yellowstone Natl
Park).
        I am just starting to setup an APRS base station and also mobile.
My experiencec with windshields has been that any of them that have
electrical
defrost are as good as solid lead to RF.  So far, the GPS antenna
has to be outside.

        Does anyone have info on making your own GPS antenna?  I ordered
one from Magellen, but they seem pretty costly for not much antenna.

For what it's worth, I cant figure out why it is legal to transmit something that another "service" makes available. Isn't there some rule about that?

If DGPS is a service that is available isnt it a no no to Xmit that ?
Also, doesnt the CG already broadcast that in the area ?

Yes, but it also makes it practical to mount the antenna INSIDE the car overhead, since the signals will pass thru the fiberglass (one local had done just that here in Boston)

APRSdos REPLY/COMMENT:  APRS session at 1400 Saturday.  I cant believe I
am going to do 8 hours of driving for a 1 hour pitch.
Probably 6 people will show...   Ill go down 301 and 17, you will probably
go 95.  Maybe we will see each other simplex, h i hi.  I will be running
APRS MicEncoder on whatever 2m voice repeater is strongest.  147.15 in MD,
147.015 near frederick.  Ill try to get into 146.88 in RIchmond,  dont
know any repeaters in Va Bch...

651. pcmcia cards

From: Ron Reeves <reeves@christenson.com>
Date: Thu, 19 Sep 1996 21:35:16 -0700
To: aprssig@tapr.org
Message-ID: <1.5.4.32.19960920043516.006651b4@hevanet.com>
Rendered body type: text/plain

After reading the interest in pcmcia cards I started searching the net to see what exists. Has anyone ever tried the gps pcmcia cards? They look like they might save in cables, batteries, and effort in making a complete portable setup.   The cost is fairly high (around $600.00-$700.00), but if they work great the convenience may be worth the extra cost. And, should a tnc pcmcia card appear on the market it would be easy to get a small hassle free setup.

The site I found info about the gps card was http://envoydata.com/index.html
And the unit I looked at was a Centennial TechnologiesThe SatNav GPS. But I see that trimble also makes one.

***Bob will they work with APRS DOS??

P.S. How are the APRS shirts coming??

655. Map Data anomalies

From: "Bill Neal/N0NSA" <wmn3@dfw.net>
Date: Fri, 20 Sep 1996 00:36:42 -0500
To: <aprssig@tapr.org>
Message-ID: <9609200539.AA17294@dfw.dfw.net>
Rendered body type: text/plain

Hello;
I've been having problems with MK100K2A. Currently I have several geographic areas (over 150 files) in the DLG directory (folder). When I run MK100K2A it'll start making a 16 mile or less map, but will only make certain sections of the overall map. The missing sections seem to conform to the USGS files (ftp'ed files). It will make a map, with sections missing, reduce the map points, show it as in APRS, and quit the program as per normal.

Won't MK100K2A crash/stop if all the USGS files for a given map scale/area are not in the DLG directory? Can you have too many files in the DLG directory?

I know that with Win 3.1/3.11, file manager, a compressed hard drive, running Defrag once in a while, and you move (not copy) files from one directory to another, Windows sometimes doesn't set the new directory name/location correctly for DOS programs to read. However, Windows will still be able to find and use those same programs/files, in the directories that they've been moved to.

I'm now running Win 95, up-graded from Win 3.11, and am wondering if this isn't a symptom of the aforementioned problem... Anyone have any suggestions or fixes?

I'm going to buy a new HD so I don't have to compress it. Maybe this problem will go away... I hope.

Cheers, Bill Neal

Another reminder of the balloon lauch here in Huntsville, Alabama.

It looks like the weather might cooperate with us.

Date:   Sunday September 22
Time:   0700 - 0900 CST, Most likely 07:30 CST
        34 41'15 North
        86 33'35 West

        Altitude above 75,000 feet

        Anticipated landing area, ear Grant, Alabama
        34 31' 4 North
        86 14'23 West

Profile:
        Two (2) hours climb to max altitude
        One (1) hour drift at max altitude
        Thirty (30) minute descent

Callsign:
        The ATV downlink will be identified by an automatic video
        overlay (About every 6 minutes) by the call KE4ROC-11

        All packet transmissions from the balloon package will also be
        identified by the call sign KE4ROC-11

ATV:
        One Watt, PC Electronics KPA5 70cm ATV transmitter
        "Little wheel" Horizontal polarized Antenna
        434.000 Mhz transmit freq (Cable ready TV Chan 59)

Telemetry/GPS:

        Five (5) Watt MFJ data radio transmitting on 145.790 Mhz
        APRS Automatic Position Reporting System

        APRS Telemetry will also be transmitted on 145.790

Please look for the balloon and look at the Text file on Tapr called
HSVBALL.TXT for all the info on this balloon.

Funny you should mention that.  I was just talking to another ham today who
mentioned that last months storms in Phoenix not only knocked out the power,
but land lines as well.  He was with the Sun City VFD at the time and cell
phones were not working either, nor were their pagers.  BUT the 2-meter
repeater with emergency power atop a local hospital was working just fine.
I was in South Dakota at the time, but several friends called my mother to
find out where I was when they couldn't reach me at home.  They know I'm a
HAM and wanted to know what was going on as they were mostly incommunicado!

COTs is great when you can get them into the disaster area, but I remember
the blizzards of 1977 and 1978.  We had no power for a week because our
power substation shorted out due to being buried by TWENTY feet of snow!
Sure they had entire substations that could be trucked in and set up in
hours, but again TWENTY feet of snow!  Yes they had big helicopters flying
around that could lift the equipment, but again we had TWENTY feet of snow
(!) on the ground.  We had snow on the ground until the end of June that
year.  Ice flows on the Maumee River that spring were so thick they clogged
low lying streets and highways and had to be dynamited just so traffic could
get through.

I couldn't get ahold of my ARC the weekend of Field Day this year because
forest fires had burned up the phone lines going into the campground we were
staying at.

>Robert might also want to reread Part 97 to remind himself what the FCC thinks
>the purpose of HAM radio is...
>

Agreed.

Yeah, I know this is the APRS sig.  I'll get back on track.  (G)

No it won't crash just because there is a file missing (It will make a half map)
But YES you can have to many files in that directory!. I have found that if you
have somewhere around 48 Meg it will work but much over that and you start having
problems. Also make sure there's nothing but map data in that directory (Nothing
else)

Rendered body type: text/plain

for n0nsa
Upgrade to mk100kv3. I have posted it to TAPR.
This should take care of the problems u have encountered.
there were a few bugs that i think i have exterminated. With the new version
u can make a large number of maps in one sitting (up to 576). the new version
does not stop if u go outside of the available USGS data range. It just goes
to the next map and writes a comment in a .log file
Yes u can have too many dlg files. the current limit is 100. any extra are
ignored. which ones? depends on the order they are stored in the
sub-directory and how the "files" connand from qbasic reads them into a list.
I will forward more details posted on this sig earlier.
happy map making jack, KB4XF

661. followup on WIDE,WIDE,WIDE

From: Bill Northup <northup@sw.stratus.com>
Date: Fri, 20 Sep 1996 09:56:12 -0400 (EDT)
To: aprssig@tapr.org (APRS)
Cc: northup@sw.stratus.com (Bill Northup)
Message-ID: <199609201356.JAA06927@blackdog.sw.stratus.com>
Rendered body type: text/plain

I have been away since my last posting (forced to go to interop) so was not
able to follow up at that time. Before I left I heard form hasan schiers, N0AN
that he was sure he only was sending GATE,WIDE.

So last night I used a dumb terminal program to see what was coming out of the TNC. Within a minute I saw N0AN>GATE>WIDE>APRSW/H: followed by 6 N0AN>GATE>WIDE>WIDE>WIDE>APRSW/V:'s so it is our local gateway that is adding two WIDE's to the path. That sure looks like the gateway is adding to the unproto path.

Also I just saw the following posting:

```
> From local observation, I think that W1ON-3 is changing the paths of
>stations gatewaying through him by adding 1 WIDE to whatever the originating
>station sends. Initially, I think it was being done so that all of the HF
>stations would be heard by the local WIDE and Digipeated. I get the
>impression, based on the "nice" status messages it send out, it is a
>homebrew program doing the path modifications. Clearly APRS won't do that.
>
> The Sysop of the station is Doc, W1EO. Does anybody know his email address?
> Maybe some local in the Boston area can drop him a message next time W1EO
> shows up on the screen? I will if I see him!
>
>  73,
>
>  Tom Kinahan N1CPE
>
```

So it looks like it is a local issue, and explains why a number of us had seen so many WIDE,WIDE,WIDE's on the local VHF net and no one else outside of the area could confirm it. I will work with the local group to fix this issue.

Thanks to everyone that has watched us figure this out.

Bill

665. Com port problems - WinAPRS

From: "Ken Mirabella" <kjm@deltanet.com>
Date: Fri, 20 Sep 1996 11:18:51 -0700
To: <aprssig@tapr.org>
Message-ID: <199609201821.LAA09354@mail1.deltanet.com>
Rendered body type: text/plain

Greetings:

I am having a problem getting the serial port to open on WinAPRS Ver 1.13 (registered user).   It works fine on my win95 machine, but does not work on my 386. I have install win32s.dll and Freecell runs. I have added the serial DLL's to the windows directory and have a set in the winaprs folder as well. Previous to adding the serial DLL's to the windows directory a message came up stating serial DLL's needed.

Upon running the program I get quite a few windows that pop open that state Port failed to open. I am using com port 1 and this port works fine when running Paket 6.1 with my TNC. So I know that it is not a hardware problem.

Is there something I missed.

Thanks to all that respond.

73, KM6YH

666. Secondary Freq Ref for 30m

From: schiers@ames.net
Date: Fri, 20 Sep 96 11:15:01 -0500
To: aprssig@tapr.org
Message-ID: <199609201851.NAA12677@tapr.org>
Rendered body type: text/plain

After conferring with Bob about the "spreading" problem on the 30m net, I have zero'd to W3ADO, changed my alias to TUNE1 and placed this info in my beacon. Those of you who need to know "where" the net is actually operating, and can copy me well, may zero my signal.

The TUNE1 alias will allow you to ping me and see if you are on freq, assuming you are using Bob's software. You can also connect to N0AN-1 which is my tnc based bbs to confirm that you are on freq.

Note: This is NOT an indication of absolute frequency. It is an indication that you are on the same frequency as W3ADO and N0AN. Bob has indicated to me that W3ADO is THE standard for the net.

>After reading the interest in pcmcia cards I started searching the net to
>see what exists.

Socket, the same people who make the Serial PCMCIA card.
There are several others and Keith ,I seem to remember, has played
with them.

BUT why spend $600 for one card that still needs a cable to the antenna.
You can have four Garmin-20 or almost three Garmin-45 stand alone units.
They don't all output standard NMEA so will have limited application and
will need special software drivers for the different platforms and
software programs.

If we could get more than one built in serial port on our
portable computers we would not need these extra PCMCIA TNC/GPS cards.

In most of the other problems I have encountered the problem has been
incorrect or incomplete Windows settings for the Comm port. I know you
said that the other program works fine, this isnt good enough, some
programs for Windows 3.1 talk to the hardware directly or by-pass the
Windows stuff. WinAPRS goes thru the OS ONLY and therefore the Windows
settings MUST be set correctly.

Also try starting WinAPRS from the File manager, not from Icons or short
cuts, i found that this sometimes cures the problem.

Mark

670. Re: [APRSSIG:4894] DGPS Tests in Balto/Wash Area

From: clark@tomcat.gsfc.nasa.gov (Tom Clark -- W3IWI)
Date: Fri, 20 Sep 96 19:47:12 UTC
To: aprssig@tapr.org
Message-ID: <106818@tomcat.gsfc.nasa.gov>
Rendered body type: text/plain

```
As a followup to yesterday's posting, be advised that the W3IWI-13 DGPS
beacon is on the air on 145.79 as of about noon today (9/21).

The DGPS QTH at my GODE ITRF site isn't the best in the world -- the terrain
is relatively low and the tower is only 30' tall. I am anxious to get signal
reports to see if the coverage is useful.

As WB4APR reported with disgust/frustration about the Balto/Wash situation:
>Basically, from the biggest east coast net, we can now barely see anyone!
>ARGH!!!
In watching the activity today I only saw 4 stations. If the coverage from
IWI-13 is inadequate, I don't have many choices in RELAY sites -- the best
would be WB3V-11. The DGPS beacon is currently sending <UI> frames to DGPS
with no VIA. If the direct IWI-13 coverage is inadequate for some in the
area, I wonder if you are able to copy WB3V-11? Since the DGPS signals
are designed to be used within 50-75 km of the beacon, and since the
beacon's heiroglyphics are sent every 20 seconds, I feel it would be
a bad idea to try to use multiple RELAY or WIDE routing.

To answer two other questions that were raised:
- All you should have to do to make use of the DGPS beacon signals is to
    -- set your TNC to 4800 baud
    -- make sure that the Monitor functions are working
    -- Poke the RS232 rcv output from your TNC into the serial input on
       your GPS receiver
    -- Enable DGPS inputs on the GPS receiver if necessary. For the Garmin
       GPS-38/40/45/455XL, go to the configuration menu and select the
       INTERFACES item. Then select either NMEA/RTCM or NONE/RTCM items.
       (for a 45XL, be sure to select 4800 baud to match the TNC speed).

  For testing the beacon's data output, I used a 45XL and it worked fine.
  You know that you are decoding DGPS signal by looking at the screen that
  shows GPS satellite az/el. At the top of that screen you will see text
  that says something like "3-D Differential", and the S-meter bars will
  show a "D" for those satellites that have DGPS corrections.

- Regarding the Coast Guard and legality: W3IWI-13 is using bits derived
  from a totally different source. Given the accuracy to which the antenna
  location is known, and the fact that a Hydrogen Maser frequency standard
  is in use, the accuracy of my corrections should be BETTER than those
  sent by the Coast Guard! So I consider the point moot.

  I'm not convinced that it would not be legal (double negative used
  intentionally for obfuscation!) for an amateur group to purchase one
  Coast Guard DGPS receiver (typically ~$500) and then re-send the bits
  on amateur frequencies. Since the Coast Guard gives the bits away free,
  they are in the public domain as soon as they are transmitted. This
  would probably not be the case for the DGPS bits sold commercially by
  DCI or ACUPOINT -- they "own" the bits and you subscribe to their service.
  But this is a point for all the Jail House lawyers to debate.

Again -- please give me feedback on (a) can you hear W3IWI-13 and if so
(b) does it work for you and if so (c) what kind of performance are you
seeing?

73, Tom

1.  Going thru the all imprtant Read Me files, I don't see an APRS symbol for
an Emergency Operations Center (EOC).  Have I missed something, seems like
one that would be needed.  A demo APRS station is up and running in the
Jacksonville, Florida EOC and we would like to use the appropriate symbol.
 Any suggestions?

2.   Also, how about a symbol for an evacuation shelter?  Maybe even one that
could be yellow prior to opening, green when open, and red when full or some
other informational system?

P.S.  Jacksonville, Florida now has a digi high (435' AGL) atop a building in
downtown due to the efforts of AA4QI.  Digi is AA4QI-1.  Work is still under
way to optimize the set up, but now we are on the APRS Map!

Message-ID: <2.2.32.19960920230407.0067ae08@mailhost.primenet.com>
Rendered body type: text/plain

```
Here is the problem, getting GPS data to run thru APRS, into a KPC-3 and be
transmitted.

SYSTEM:  IBM Thinkpad 760, Garmin GPS-45, Kantronics KPC-3, APRS 7.7b, "Y"
harness (GPS-45 to Comp. Serial Port to KPC-3 Parallel Port).

I set the KPC-3 to a baud rate of 4800, the GPS-45 to NONE/NEMA and APRS to
baud rate of 4800.

What I get on the APRS screen is: the GPS data flowing across the bottom of
the screen, and in the top right hand corner I get the message "TNC not
responding" AND I/O-glitch. Therefor nothing is sent to the TNC to be
transmitted.

I have tried everything that I can think of, with out success. The really
maddening part is that last year I had this working on my IBM P\S Note just
fine.

HELP. I am stuck. Nothing that I have tried has worked. What am I doing
```

wrong, not doing..Etc.

In advance, thanks for taking the time to read this, and for any help that you may be.

Alan,
The "Y" cable is the problem. You cannot feed the GPS to the TNC and have
the TNC trying to communicate with the computer at the same time. You need
to use a switch or feed the GPS to one com port and the TNC to another. That
is what I do with my GPS75 and KPC-3.

Peter described it to me one day. It has an excellent modem that has
excellent filtering. It knows where exact center frequency is for the
tones. Once you know that then you know how far off you are from the
others or vice versa if you are the standard. He had me going up and
down 10 hz at a time tweaking in my frequency to his.

All it takes is one station to start with.  If the Easterners beat to
Peter and the Westerners beat to one of them then they are all together.
Pick a station, hopefully one with a stable rig, and start there.

That was my first feeling, that it would be too flimsy.  I have two
PCMCIA cards, a LAN and a MODEM card, and both have very delicate
connectors.  I would not use one in the car if it was open to being
bumped. The things are just too expensive.

Rendered body type: text/plain
```

```
ATTN: APRS'ers APRS SPECIAL EVENT..           Filed: 210500GMT SEP 96
    Rick/KN6KB and his S/V Second Wind, 42footer, deptarted Berkeley, Ca.
Yacht Harbor this morning for a long voyage to Cape Canaveral, Fl. Due
to seasickness of a green crewmember, his first overnight stop was here
in Pillar Pt. Princeton Harbor, just north of Half Moon Bay.
    This first leg is to San Diego, Ca. about a 4 or 5 day voyage. Rick
will be up on 145.01/VHF for northern Ca., and 145.79 down in the Los
Angeles, San Diego area. He will also be on HF/10151/lsb for his APRS
tracking and 14065/Pactor for messages and QSO's with Bill/KB6LFM.
    On October 28th, Rick will sail in the Baja HA HA race from San Diego,
to Cabo San Lucas, Baja Calif. Mexico. GPS APRS tracking from then on will
be on 10151/LSB HF. After the race at Cabo, he will journey down the
Central American coast, stopping at various ports along the way.
    His plans are to be in Ziuhatenejo for two weeks and fly home for
Xmas holidays and return and continue trip down coast to Panama and
thence in 97 to Cape Canaveral Florida.
    Rick is a strong supporter here in Calif, of APRS and enjoys the GPS
tracking and we hope to have a complete voyage GPS/APRS HST tracking file
when all is done. We need the cooperation and help of all APRS users and
interested parties, to keep his positions posted and communications with
him for APRS activities. Rick has already authored an article in the
"Cruising World" Yacting magazine,(Feb/96), and this voyage should also
spurn another sailing article and the great virtures of GPS/Tracking/APRS,
and of course Ham Radio for Yachtsman.
   So the participation and support of all the APRS family will be
appreciated. Hopefully we will keep you all updated of events along his
cruise.
     73's & Enjoy, Bill/WB6LPG @KA6EYH.#NOCAL.CA.USA.NOAM <bbliss@juno.com>

Well had another foxhunt tonight using the DFjr. There was a group of 8
or 9 hunting groups, besides myself there was one other person using a
homebrew doppler system with antenna array at 120 degree, so he used 3
antennas. Well i came in first and the other doppler cam in second. For
those wanting to know about the DFjr it works perfect. This hunt was
right in midtown Huntsville and locating the fox i never made a wrong
turn it led me right to the fox who was sitting in a car parked in
someones driveway, but of course he wasn't visible because he ducked down
below seat back level, and don't forget this was at 9:30 PM pretty black
around there at that time of night. So to sum this hunt up the DFjr
worked just great (Of course it did i came in first Hi). The only bad
thing about this is the way they work it here is that the winner will be
the fox next time, i don't realy want to be because i like the hunting
part better. O well.

For those interested in APRS logo's I have added a new one you may be
interested in. As a service to the Amateur radio community i will for a
limited time offer my services to those that wan't one of these made for
your state. You of course have to look at this logo to know what i'm
talking about Hi. This page i'm sure will be slooow in loading for the
average system so be aware of this. Remember to capture any of these
logo's using Netscape you have to click your right mouse button when the
pointer is on the logo, don't know about other browsers.

Well just got back from a 500 mile round trip to VaBch for a 1 hour talk
on APRS.  Its was pretty well attended, about 20 to 30 people showed up.
Hope this plants the seed in Norfolk and RIchmond...  Only new thoughts
```

during the 12 hours on the road as I used the MicEncoder on every 2m
repeater I could find, was the way to ID.

Typically I say WB4APR GPS PACKET MOBILE

Or APRS MOBILE

or GPS mobile.

I donno which one is more meaningful. There are folks who dont know what
APRS means and there are HAMS that dont know what GPS means... hi hi

695. GPS via fiberglass and SNR?

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sat, 21 Sep 1996 21:20:09 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.960921211305.19921D-100000@arctic>
Rendered body type: text/plain

On Fri, 20 Sep 1996, Richard Garcia wrote:

> Has anyone tried to attach a GPS antenna inside of these fiberglass bodies
> (with silicone or such) and see if that worked?

APRSdos REPLY/COMMENT: Today I did that test. Remember that the entire
roof of the Transport/Lumina/Silouette is plastic, with only a steel shell
around the edges. I could hold the GPS unit to the roof over my head, and
get a few satellites, but SEVERAL DB below what I got holding it out the
window. THis raises a question which TOM CLARK clarified for me and maybe
he could clarify again.

He says the that Signal-to-noise level reported by the GPS units is not a
true SNR to thermal noise, but SNR to channel noise level which for one
satellite means its signal compared to the noise of the receiver AND all
the noise of the other 7 satellites in view. (did I get that right Tom?)

I notice that when my garmin 45 gets its first 1, 2 or 3 satellites, they
are FULL strength over the top graph line. But once more satellies get
locked on, the signals reported for those initial 3 satellites goes
down... Is this what you are talking about Tom? Or was this just a
fluke?

```

APRSdos REPLY/COMMENT: Be sure it is APRtrak version 0.5 or later. 0.4 is stuck in Eastern Standard Time. Be sure to enter your correct time zone offset when you start APRtrak. If you have saved a config file it will start with what every time xzone you had before, so be careful when you change between Standard and Daylight time.

Bob,  what is an HSP switch?
If it's a small chip or a few discrete components that automagically
suspends throughput from the computer to the TNC when the GPS is sending
data,  I understand.  I would like to know what the "HSP" stands for in
any event.

My dad, KC7EPD runs a PK-96 on his laptop with a Garmin-45.  From the
>EXTERNAL< view the adapter sure
 looks like a Y-cable to me.  All it does is allow him to route the GPS's
data into the same data
stream /RS-232 port that the TNC uses.  I admit I've never cracked open
his case to peek inside, but for only 31 bux I'd be surprised if there
was more than just a couple of solder points for the GPS cable.

If there is more to it, I'd appreciate a schematic for such a circuit.  I
believe I have a practical application for one.

Ken,

I tried to download the file but I get an error message. I live in San Pedro
Sula, Honduras (on the Atlantic side) and *had* been thinking of making an
APRS map of the country. Of course, now I don't have to (and thanks, by the
way!) but, I already had taken several GPS readings around HR land (cities,
villages, node and bbs locations etc.) and if they would be useful at all I
can e-mail them to you so you can add them.

When is Rick comming down this way? I can give him (or you for that matter)
several 2m Digi routes so we could see each other.

Thanks again for your work!

73 de Rick, HR2KOS

snip....

Didn't mean to butt in, Bob, but because I noticed the question, and
knew the answer, so I thought I'd provide the answer to Kevan. HSP
stands for Hardware Single Port. If you have a copy of APRS, look in
the docs: GPS.txt file, Kevan. Bob not only explains the HSP, but shows
a schematic of the same. If you don't have a copy, obtain one from the
tapr ftp site: ftp://ftp.tapr.org/tapr/SIG/aprssig/files/upload/

Look for the latest aprsnn.zip file. Currently: aprs77b.zip

Hope this helps.

Bob Bruninga/WB4APR

Sir,
I recently sent a request and check to register my APRS74 program with
you. I also asked for an updated version of the program. I am now running
APRS75C and no longer require the updated version, but I do need to register
my ICOM GP-22 GPS that I use with an AEA PK-12. Please do not send me an
upgrded APRS program, but instead, send GPS registration number. Thank you
for your time.

Here is a wiring diagram that was on the sig around Nov-Dec of last year that makes a "y" cable for the Garmin-45, KPC-3 and a laptop. It has no switching, so whatever problems that may create you would have to deal with!

```
9 PIN           25 PIN

1       to      8
2       to      3   + Brown wire from GPS-45 power/data cable
3       to      2   + White wire from GPS-45 power/data cable
4       to      20
5       to      7   + Black wire from GPS-45 power/data cable
6       to      6
7       to      4
8       to      5
9       to      22
```

Also, the mod on page 96 of the KPC-3 manual will supply power to the GPS-45 through pin 25! Makes a nice installation.

713. HF APRS Transceiver for $199

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 22 Sep 1996 13:31:04 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.960922132117.27630A-100000@arctic>
Rendered body type: text/plain

I am still convinced that a 50 watt black box stick-it-under-the-seat HF Xtal controlled 10.151 packet transceiver can be built for well under $199. Ten tec seemed interested but still say there is no market.

Anyone want to investigate? There are lots and lots of QRP kits available and there have been articles for 20 and 50 watt two and 3 transistor PA's. A great contribution to HF APRS could be made by someone researching these articles and kits and finding what is the best combinatation for APRS HF packet Mobile. I will NOT go buy a $1300 HF mobile rig to do APRS. Its just too big a toy at risk in my car. But 50 watts or even 10 watts is worth putting under the seat or in the trunk if we can do it for under $199.

If you dont believe 10 watts is worth doing, replay XMAS93.HST included in all versions of APRS. That is a track history *as-received-in Maryland* of my trip to alabama using only 10 watts and a mag mount HF whip on the roof of my car! It was a solid track (except when I switched to VHF through Chatanooga and Huntsville...

I am ready to buy a XTAL HF Xmtr for 10.151 but need to know what is best.

We need experience on direct conversion receivers for use with packet too.

If you have any experience in these areas, please consider taking on the project. If you wanna make a comercial product, BE MY GUEST! Ill buy one!

>>APRSdos REPLY/COMMENT:  There is no such thing as a "Y" cable.  It

There is a "Y" cable, but that is only used in cases where you want to
connect stereo audio jacks to a mono jack, hence the "Y".   It is also
used in the broadcast radio industry to route a single audio signal
in two different directions, as an example, a radio talk show out
over the air live, and fed to another radio station or satellite, live.

Also, I have a KAM PLUS, and I use it on both VHF and HF
simultaneously, and it has a RS232 connector going to the PC, and
about half way down the cable, it goes in 2 directions for the mic
connections, one way to the VHF radio, the other to the HF radio,
and it looks like a "Y"....  Though, this is not what the discussion
involved (mic cables), I thought that I would make note of the fact
that there is such a thing as a "Y" cable.  There might be another
name for it, but calling it "Y-cable" is easier to picture.

APRSdos REPLY/COMMENT:  Hardware Single Port Switch.  It is 2 transistors
and a few diodes and resistors.  It lets APRS switch between the GPS and
TNC by raising and lowering the laptop DTR line...  Or just use a SPDT
pushbutton switch to do the same thing manually whenever you need a fresh
Posit on your map.

APRSdos REPLY/COMMENT: What he means to say is that this Y cable cannot
be used with both the GPS and a TNC at the same time!!!!!!!! Yes, it is a
Y cable. Just dont plug the GPS and TNC in at the same time, hi hi..
So it is NOT an HSP switch and it is NOT going to let you operate APRS and
GPS and TNC at the same time. But ifyou add a simple Push Button switch
on the RXD going into the PC, then you CAN.

At VA beach, I had to buy something. A shady looking character had a
typical pile of junk including 4 laptops. He wanted $75 each and
claimed he did not know if they were good or not, but I suspected that he
certainly would have tested them before bringing them so they must
certainly have been bad.   Only 1 had a P.S. and it did work, but it was
a dual floppy system. I chose the 286 with a clearly bad LCD
display (looked like a termite got behind the glass). Just charged the
battery and it looks great! (except for the termite area...)

I have no PC nor info on the 4 pin power connector. Anyone out there have
info on this NEC/Ultralite 286F black laptop? It will replace my old big
Zenith in the car...

Well the Huntsville balloon launch finally took place after a very
lenghty delay due to several problems. One was that twice when ready to
launch the parachute fell off (Yes it did). Then there was a bigger
problem when the balloon hit the ground enough to vreate a 8 inch hole in
the side, when that was repaired using good old ducktape from Wal-Mart
and added some more helium to make up for the loss it was ready to go at
around 11:30am, well that's what everyone was thinking Hi. When it was
finally launched and went NE it got hung up on a telephone cable that was
about 25 feet of the ground. With some quick thinking (I think) someone
got a hook and broke the payload loose from the wire. Finally we had
liftoff (Yes it realy did this time). It went SSE from Huntsville and i
finally lost the position beacon when it was nearing Atlanta (Actually
between Atlanta and the Alabama state line. Seen N4NEQ-9 place a object
on the map there. Not an un-eventfull day!. By the way last altitude
beacon i seen it was only at 32K feet.

723. MIM Board & GPS20

From: JohnLGaf@gnn.com (John L. Gafford)
Date: Sun, 22 Sep 1996 17:24:56
To: aprssig@tapr.org
Message-ID: <199609222224.SAA31380@mail-e2b-service.gnn.com>
Rendered body type: text/plain

I have a MIM board tied to a Garmin 20 with the Oct-95 QST Patch
antenna attached. With a "str" = GP??? in the MIM I get $GPGSV
statements with up to 8 satellites, and data on three or four.
When I set "str" to GPRMC I get a fix statement that looks like:
<call> 221122 ,162438,V,,,,,,,220996,,/GPS FIX. I suspect that I
am getting satellites, but without sufficient signal strength to
get a fix. Anyone with any ideas? Would a Trimble active GPS
antenna work on the Garmin, and would it help get a fix? HELP,
please. John, N5XAK...

Just got back mysellf from Virginia Beach Hamvention where I got to meet Bob
in the flesh. He's taller than he seems on this SIG.

Excellent 1 hour explanation and demostration of APRS. Bob even got a
better spot in the program than Gordon West! There is no truth to the rumor
that he bribed Many for the slot.

Bob did fumble a bit trying to bring up .hst files for the neat VGA
projection screen. The lesson I guess is to prepare by putting good stuff in
a special subdirectory......../snakeoil/.....???

Great dog and pony show Bob.   Hope you get some converts in Norfolk or
Richmond.

I though about it, but I have to agree with Ten Tec. Their really needs to be
some commercial applications to justify it.

To: aprssig@tapr.org
Cc: aprssig@tapr.org
Message-ID: <107002@tomcat.gsfc.nasa.gov>
Rendered body type: text/plain

John -- in the GSV message for each satellite you are tracking is
also reported tehe SNR. Numbers like 40-50 are good. My "Totally Accurate
Clock" (TAC) "SHOWTIME " software includes a barchart SNR plot in realtime
to help you see what is happening (the bars for the Garmoiin have 20 subtracted
from the reported values) as a function of azimuth & elevation. All my TAC
stuff is at URL

  ftp://aleph.gsfc.nasa.gov/GPS/totally.accurate.clock/

To use SHOWTIME, you will have to add one wire from the GPS-20 to the PC
so that the computer gets the 1PPS signal on the DCD line; see the PostScript
schematic in the file emulate.zip for details.

The latest SHOWTIME code is in the /distribution directory; see the readme
file for instructions on how to make an installable distribution disk.

727. unproto

From: jclakeland@ucdavis.edu (John Lakeland)
Date: Sun, 22 Sep 1996 19:08:30 -0800
To: aprssig@tapr.org
Message-ID: <199609230206.TAA15684@franc.ucdavis.edu>
Rendered body type: text/plain

Ladies and Gentlemen,
    I can appreciate that hard limits on unproto paths would not be
desirable. Unfortunately there doesn't seem to be any definitive text on
how the system works and how and why to set one's path. This is important
in a system such as APRS which is enjoying substantial success and gaining
new users every day. If one of you who have been in this for long enough to
know how it all works were to publish such a document, then at least nobody
would have to be screwing up out of ignorance. I have really made an effort
to find this information and if it exists, it's at least not very easy to
find.

Regards John Lakeland kc6vlr

APRSdos REPLY/COMMENT:  APRtrak stores your CONFIG file in the ROOT
directory of your CURRENT drive.  So when you make a "disk" from the
C drive and copy it onto the 8088, then the CONFIG file is NOT getting
copied over.  If you are running APRtrak on the 8088 from the A drive,
then the CONFIG file will be saved on the A drive...

In other words, you gotta save a CONFG file on the machine you are using
after you get all the clocks and Time zones correct...

734. Huntsville Balloon details

From: rwf <rwf@mindspring.com>
Date: Sun, 22 Sep 1996 23:48:00 -0400
To: aprssig@tapr.org
Message-ID: <2.2.32.19960923034800.007023c8@mindspring.com>
Rendered body type: text/plain

```
Balloon landed in a Kudzu patch behind the home of a sweet elderly lady, Ms
Swafford of Dallas GA.

We used a kit-built Directional Systems Doppler DF  (for info email
ka4iia@radio.org)  on the hunt and to to locate the house it was behind and
then used a 4 element beam with an attenuator to close in on it. When 50 ft
away, we heard the piezo sounders.

APRS was extremely useful, and plotted the first half of the flight well.
However due to garbled TNC data during the last hour of the flight, we only
got 2 valid digi-able reports. I'll post a history file on TAPR as soon as I
clean it up.

N4NEQ ( Ralph Fowler- rwf ) was copying the garbled data manually and
deciphered the last few position locations, the last of which was very close
to the actual landing site.  Even after we had located the package,  the TNC
continued sending garbled data with positions all over the map.  All of a
sudden it did send a garbled packet with the correct position.   Because the
garbled packets were not digi-able, all deciphered-received positions were
entered manually into APRS for others to see.  A WIDE,WIDE,WIDE path was
used temporarily during this time to ensure that all possible distant
stations got the word that we had recovered the balloon.

The Huntsville foxhunting team arrived about 2 hours after we retrieved the
package.  They had a long 4-5 hour drive each way!  Bless them!

Atlanta Team members were:

Ralph Fowler, N4NEQ  rwf
Eddie Foust, WD4JEM
Steve, KD4GVP
Tom Armour, KE4WIO
Ted, WB4CAB
Avery Davis, WB4RTP
Kip Turner, W4KIP
and  Brandi, the balloon sniffing Rat Terrier puppy !  (who had stowed away
in Ralph's van)

KC4ELV and KD4ICT helped out with some remote bearings.

It was fun!!!

Has anyone asked Ramsey or MFJ?  This is right up their alley, and they
are small enough that they don't have to sell a million units to cover
development costs.

>please. John, N5XAK...

Well John this sure looks like your message of Sept 15 called
[APRSSIG:4755] Garmin 20 and MIN Board.

Use Bob's SIGPLOT DOS basic program to track what the unit is sending and the progress of the fix locking in. The plot will also tell you if you are getting a good signal.

Patch Ant works better for sats overhead and down to say 45 degs.

Some said to use a stiff 5.2 volts power supply and also to take the unit outside for a few hours.

I got a lock in the window using a Garmin-45 Ant after 45 Mins.

SIGPLOT on www.tapr.org and may have been part of complete aprs pkg.

IF a MAC user then run a MACaprs version less then 2.6.0 and watch the GPS/NMEA sky chart window #9 ; Don't use version 2.6.0 as the GPS sky chart is missing. The chart look a bit like the Garmin GPS display but with better resolution.

MFJ makes a 20 mtr qrp ssb transceiver that sells for around $230.  It
would be perfect for this if they could do a 30 m version, or if the 20
meter net ever becomes reality.  The other qrp rigs are mostly cw only
and would require some kind of direct fsk mods (have to modify the tnc,
too) to work.

You are so right John, and don't feel bad i have been at this for more then 3
years and i don't fully understand it either. A good example that there should
be clear documentation available is last night i seen a group of mostly new
users within a 10 mile radius of a good digi keyboarding with each other all
night long, most all of them where using path's of 2 digi calls then 2 wides
```

added 1 even had relay added to the path. And this i believe is only because
of the lack of clear documentation on how this works and why, and what it does
if you use them in a way you shouldn't. But i asked this question a few years
back and was told to read the documentation. I hate to say it but there are
those users that are truly informed as to how all this works, but forget they
had to learn somewhere also Hi. I would love to add a page to my webpage on
this subject!.

```

As Bob B. knows, I looked into doing this about 18-20 months ago after he
and I discussed it at some length (we live only about 15 miles apart).  At
that time, I had a preliminary design and had even purchased parts for 2-3
prototypes.  (At that time, the power output discussed was 10 watts - I'm
not sure how it jumped up to 50 W).

They did not get built due to "other priorities", but the thing that
stopped me from thinking about going much further is that I would have had
to had the receiver tested in order to meet FCC part 15.  That would have
been $1500 to $2000 to a testing house.  It is somewhat incredible that one
can produce an HF transmitter and sell it without testing, but anything
with a receiver (in this frequency range) in it gets tagged with this
"barrier to market entry" fee.  Obviously, this fee has to be spread out
and covered in the price of the product.

In any case, I think Bob's price of $199 IS realistic (for a single
channel, single band unit with 10 watts output).  However, there needs to
be an *amateur* market of more than 20-30 people to make it worthwhile.  If
the market could generate maybe 500 unit demand, then it would be a
reasonable thing to proceed with.  (note: I used to work for Heathkit, so I
am pretty familiar with pricing this sort of unit for the amateur market).

Somewhere I had a set of specs for the prototype that I was working on.
Perhaps I will post them on the net, here, and see what comments I might
get.  If you'd like to discuss this subject with me, please send a message
directly to me at the address below.  I am off to London today for a couple
of days, and will have the APRSSig turned off to keep my mailbox from
getting jammed.

John...

Has anyone asked Ramsey or MFJ?  This is right up their alley, and they
are small enough that they don't have to sell a million units to cover
development costs.

There really is a 'Y' cable.  Seymour, KC4NMY, came up with the idea of
connecting a Kantronics KPC3 with GPS rom to a TNC (input only, of
course) and the output of the TNC to the computer.  That means that the
computer will not be able to send data to the TNC (the gps can only do
that) but the TNC can send data to the computer.

If the TNC is in GPS mode it can't be controlled by the computer, but it
does receive data from the radio and passes it to the computer.  That
allows APRS to work (listen only mode) and the GPS/TNC connection sends
out it's Tracker style position reports.

In order for you to see yourself on the APRS screen you depend on
listening to your own digipeated packets.

He has also modified the 'Y' cable and put a SPST switch in so that the
computer can occasionally 'talk' to the TNC.  This is much like the 'Y'
switch described in the APRS docs, but the switch center (common) is to
the TNC and not to the computer.

No i'm sure nobody does this intentionlly, and i'm sure you didn't. This is
exactly the reason i started the Mentor page on my website, and there are 36
users that must be in agreement with the idea because they have beem good enough
to ask me to add their names to the list, but i know there are many that always
look for information but when asking them for help they are not there to help. I
don't mean for this to be a flame at anyone but i have seen this many times
before.

I would like to see Bob Bruninga add a new feature to the software so when a
person is chatting (Keyboarding) Locally within 10 or 20 miles of their digi
that it would be imposible to have any wides in your unproto path. Like i said
last night there where 10 or so users within 10 miles or so of their digi that
even i could hit direct from 105 miles away those users had two wides in their
path. Not only that but they got hostile when i suggested as new users they
should read the OPS.TXT file. On top of all that a NEW 2 week old user was
running an HF gate at the same time. So Bob please notice.

Rendered body type: text/plain

```
In regard to recent traffic.  I just re-read the OPS.TXT file and
everything about routine and special event OPERATIONS is in there.

It address digipeaters, WIDES, GATES, HF and RELAYS... etc

The file is named OPS.TXT beacause OPERATIONS.TXT is not a legal DOS
filename.  If OPS for some reason is not understood by newcommers, then I
would be happy to change the name to something that they would read...

(I did decide to re-sequence some of the paragraphs to put them into a
more logical sequence.  If there is anything that is NOT addressed in
this OPERATIONS manual, I woul dbe happy to address it...)
```

753. Wide/Relay with U-II Wx Sta

From: "John B. Leonard, Jr" <jleonard@tbcnet.com>
Date: Mon, 23 Sep 1996 11:16:29 -0500
To: aprssig@tapr.org
Message-ID: <1.5.4.32.19960923161629.0066e88c@tbcnet.com>
Rendered body type: text/plain

```
Hi,

Maybe somebody can help me.  The Kishwaukee Amateur Radio Club has got a
Wide/Relay, WA9CJN-15, that they want to use as a U-II WX site with rain gauge.
```

My assumption was that we had an either/or situation...either we could configure the TNC as a WIDE/RELAY, or as a WX station, which would reset the alias to RELAY each time dosAPRS was started. We're also hoping to keep the APRS-format for xmitted wx so non-aprs stations can read it too, ie.,

```
@230928/4155.48N/08845.07W_292/000/T058/R000/P000/U-II(auto)
```

vs.

```
#D007200020000
```

We hate to give up the Wide/Relay green symbol but the WX capability is a high priority, too.

Is there some way we can do both?

Equipment:
Dos APRS v 7.6d Validated for WX
Zenith 8088 computer with 2 serial ports
KPC-3 w/ ver 6 firmware
Alinco DR120T radio
Peet Bros U-II w/ Rain Gauge

Thanks

754. Re: [APRSSIG:5026] Re: GPS via fiberglass and SNR?

From: clark@tomcat.gsfc.nasa.gov (Tom Clark -- W3IWI)
Date: Mon, 23 Sep 96 16:22:11 UTC
To: aprssig@tapr.org
Message-ID: <107065@tomcat.gsfc.nasa.gov>
Rendered body type: text/plain

Fibreglas/Epoxy has a dielectric constant in the 3-4 range. It is lossy at microwave frequencies, which is why you don't use G10 (high quality compared to the stuff they make boats/cars/etc from) in microwave PCBs if you care about performance. I would expect that the fibreglas shell in question is about 1/4" thick, so I'd guess it will have ~6 dB loss at GPS frequencies.

If you want to do an experimental test, take a piece of the material in question and pop it in a microwave oven for ~30 seconds. If it is warm, it has a couple dB loss. If it is hot, it is many dB. FYI, the microwave oven is at ~2450 MHz, GPS is at 1575 MHz. GPS losses will be a bit less, but not by much!

Regarding GPS SNR's, the "N" in SNR is thermal noise plus the total power received from all GPS satellites. In a quiet location with a good antenna, the total of the GPS satellites will add about 3 dB of noise, i.e. double the "good" system temperature. A "good" system temperature from a low-loss antenna with a good preamp is usually in the 200-300K range, so the GPS satellites add ~300K of noise to the system. Although I don't know for sure, the GPS-20's seem to produce SNRs (as seen in the GSV message) in approximate C/No dB referenced to ~1 Hz bandwidth. The biggest S/N I've seen on a GPS-20 is ~50. Since the GPS C/A spreading code is at 1.023 Mb/s we have ~60 dB of spreading gain and the GPS signal at best is about -10 dB below the noise floor (i.e. each GPS signal contributes a few tens degrees Kelvin). Also FYI, the GPS system uses a 1023 bits spreading code, so the absolute best code orthogonality to separate one signal from another results in a < 30 dB Strongest to Weakest dynamic range; more typically for the DSP implementations used in simple receivers (one-bit sampling, throw away the amplitude, resulting in a ~2 dB SNR hit plus other implementation losses plus some nasty statistics), the "real world" dynamic range is more like 22-23 dB.

All these numbers (if you can't bedazzle them with brilliance, at least befuddle them with bulls**t!) are to impress on you that GPS is a weak signal mode and the frequencies are at microwaves! If you want good performance, be ever vigilant of losing anything in SNR! If you are mobile, try to use an external antenna. Make sure that the antenna is amplified so that you don't throw away precious dB in ohmic losses in your coax.

If you want to do another simple experiment, observe the SNR's you are getting and put your hand over the antenna. Your body will attenuate the signal (bringing new meaning to the words "dummy load"!) by a few dB.

If your setup has good performance, then you won't lose any satellites.
But if you drop lock, you had better try improving your system if reliabilty
is important to you.

755. Re: [APRSSIG:4946] Re: DGPS Tests in Balto/Wash Area

From: clark@tomcat.gsfc.nasa.gov (Tom Clark -- W3IWI)
Date: Mon, 23 Sep 96 16:48:17 UTC
To: aprssig@tapr.org
Message-ID: <107078@tomcat.gsfc.nasa.gov>
Rendered body type: text/plain

Another update: It looked like the performance was marginal with the direct paths from the W3IWI-13 not being too great. The Balto/Wash APRS lan is in shambles, but to try to improve things this morning I added WB3V-11 as a digi in the unproto path.

The main DGPS beacon "hits" at seconds 11,31,51 UTC (20 second rate). The main output is about 60 characters long. Every so often (like every 5 minutes) the DGPS beacon has an extra line appended for an additional "housekeeping" message type. There are about 6 "extra" message types, and I slowed them down, making their repeat rates related as prime numbers times the 20 sec basic rate so that they would not step on each other very often. Also, I had been sending all the data as one single <UI> frame; this was changed so that each of the messages (when more than one is sent) is a separate <UI> frame for better flow control.

The other small maintenance fix was to crank the TX audio level down -- IWI-13 sounded very "heavy" compared to other stations on the channel.

I'm still soliciting reports on the IWI-13 DGPS beacon: (a) Are you copying it either directly or via WB3V-11? (b) If you copy it, does it drive your GPS receiver OK, and (c) If it is connected to your receiver, what kind of results improvement do you see?

Making it difficult or cumbersome to put wides in the unproto path is fine with me. Making it locked out by the software itself is short-sighted, as local topography and station density determine how many (if any) wides may suit the local user community and network. We don't need big brother deciding it for us.

This is all too close to the "please save us from ourselves" philosophy

```
that has caused us so much difficulty in the past. User education is the
key and peer pressure (persuasion) is the solution to these kinds of
problems, not hamstringing the software, which has features that might be
abused in some areas, but be essential in others.

Let's not have the cure be worse than the problem it's supposed to solve.

APRSdos REPLY/COMMENT: APRS could doubtfully be that smart.  How could it
know that the person was local?  In California you can cover 150 miles in
one hop via a mountain top digipeater.  In florida, you are lucky to talk
25  miles..

> Is there some way we can do both?

APRSdos REPLY/COMMENT:  Forget the PC. A singel DIGI can do it all, but
will not show up green all the time.  I would just simply wire TWO TNC's
to the same radio.  Let one TNC (with dual aliases for WIDE-RELAY) be
the digi and the second one would be the WX station and PC computer doing
whatever it wanted...

O Come-On, if you can't hit a digi that's 10 miles away direct then you
should improve your antenna system or not use a rubber ducky for an antenna.

Good point Bob. The only thing right now that i can come up with if all digi
owners use the correct HAAT then it could be anything within that area.

BAD IDEA!  I want to give you only two of *MANY* reasons I can see:

#1  When I "sell" APRS to a ham, I want to give him a program that
allows him to see, touch, and try all the possibilities his ticket
permits.  This process, probably more than my demonstration, is what
actually gets a person "hooked" on APRS.

#2  I'd rather see Bob's energy and limited time continue to go toward
enhancements (and the infrequent bug fix...).  There's an honest limit
to how much he can cram into his code, and I'd rather have bells and
whistles, *NOT* balls and chains!

If you're gonna put restrictions on the package, why not ask Bob to
limit an unregistered user to 30 minutes?  No wait, that's not harsh
enough... Why not prevent anybody but an Extra Class ticket from using
the software?  Or "better still", why not put a virus in that destroys
the boot-sector on their hard drive if they use the wrong UNPROTO?

Come on guys!  I look on each new (or otherwise...) APRS user that's
"doing it wrong" as a real opportunity to mentor and fraternize with a
fellow ham.  It's a chance to pass on other operating "tips, tricks,
and traps" that they may not be aware of.

Well i can see your thinking, but at the same time all those users could
be paying for Bob's time by registering the software, i see many that
have run the shareware version for a year and are still not registered is
that what your looking for?.

All remaining shirts are being picked up and sent tomorrow night.
You should all have your shirts by the end of the week.

I actually broke even !!

I have several XXL shirts that are still available if anyone is interested.

If I get alot more orders I will make another run of them.

Why not use a surplus marine transceiver??

These are cheap at hamfests, especially the xtal controlled units.

They cover the freq range needed.
They usually run about 100W.

The last one I bought cost $10.00.

This seems cheap enough. If you cannot fix it if is broke then a
reevaluation of the amateur radio qualifications might be in order.

Thank you to all those who replied (or were thinking of replying) to my
request for help with my PicoPacket. A phone call to PacComm and Bob in
service led us to conclude that one of us (the TNC or me) had lost our
mind. Since the PicoPacket could not FEDEX me back to my parents, I chose
to FEDEX it to its. Hopefully that will result in a brain transplant and a
happier ham at this end.

So far so good on the customer service aspect of PacComm, I'll keep y'all
posted.

They sure are - question is, can inexpensive tncs like the kpc3 clock
the uart output at 300 bps - and it doesn't have a disconnect header
(although one COULD resort to a chip clip and leave the cover off...:-(

> there were a few that wanted to "keyboard". That's ok if your stopped but
> not at 70 mph! SO, the idea hit, is there a way of adding "programmable"
> function keys to the program? Programmable, meaning, user changable
> keystrokes. Like, "Funnel Clound Sighted at _____" or "Hello from KC5JGV
> APRS mobile!" or anything else such a series of commands.

APRSdos REPLY/COMMENT: Its all in there. Read HELP.txt about sending
messages. You can duplicate a previous message to a new station by
hitting F2 for "reply" and then the number key of the existing message
you want to send to this new person. THen hit ENTER... 3 Keys...

You can even pre-load several such mesasges by sending them to MSG1,
MSG2 and so forth. They will NOT be transmitted to MSGx... but are
available then for copying with the 3 strokes above...

VERY HANDY for MOBILES! You should be able to come up with a half dozen
generic responses that will cover most of the needed replies while you
are on the road..

The modification to the transmitter is relatively minor. (No mod is
needed for the receiver.) Typically, all that is needed is to switch a
capacitor across the VFO cap.

The line needed from the TNC should be already available on the modem
disconenct header. (Sorry, KPC-3 users...)

It's definitely not a task for appliance ops, but someone should be able
to come up with a decent "Heathkit" modification for something like the
MFJ 30m CW rig.

I'd give it a shot, but the resulting rig would be useless to me with my

```
license... <G>  Someone should check with MFJ; their rig may already
have the proper connection and/or instructions for the mod.

Well Barry, making the KPC-3 a wide-relay is a simple matter of setting
myalias to WIDE and Mynode to Relay using any terminal program or the
terminal mode in APRS...it just won't show up as a green star, but
rather, as a weather station if you are outputing weather data and
designate it with the _ symbol code for APRS.

I've noticed a resurgence in messages about getting the GPS-20 to run
 so I thought I'ld throw in my $2/100 worth. I'm now on my second board.
 The first was fried when my regulator failed. Garmin swapped it for
 $45.00. I thought this was a great deal since the board had gotten hot
 enough to melt the labels and blister the conformal coating.(BTW a fuse
 would have made no difference as the total current consumed was only
 about 500mah. All that a fuse does is prevent a fire.)

 Voltage required:

         The first power supply delivered 4.92 volts and the GPS-20 came
up each
 and every time. The new power supply is a PT5101 switching 5 volt
 regulator and it supplies 4.97 volts. Again the GPS-20 comes up each
and
 every time. It also comes up on my bench supply at 5.000 volts with no
 problems. The first power supply was a 7805 and 7 NIMH cells rated at
 1800mah. The supply now uses the same batteries. When the supply
voltage
 falls below regulation to 4.5 or below the GPS-20 still initializes but
 puts out random garbage. I'm not sure what a "hard" power supply is
 (maybe a ps thats got a copy of the "Volts of Steel" video ?). I've
even
 gotten both boards to initialize by gradually turning up the voltage on
 my bench ps from 0 to 4.9 volts.
         I'ld almost suspect that there is something else going on. It
could be
 a bad connector in the interface plug (very easy to do), or a shorted
 antenna connection. If you are getting no data out of the GPS-20 try
 monitoring the supply current with an analog meter and you will see a
 pulsing of the current drain in synch with the data sentences. This is
a
 good indication that something in your connector is not good(very easy
 to happen).
         I've had a blast with mine and really want to thank Bob and
TAPR for
 offering this board. I ran into another ham at our club meeting and
 he'ld purchased the GPS-25 evaluation kit (12 channel parallel) from
 Garmin. I was a little jealous at first. He got the board, the prewired
 connector with a DB-9 on it, an active antenna, a wall wart to power it
 and some skimpy documentation. Then I found out it cost $650. I like to
 keep my toys cheap so I'm happy.
```

Rendered body type: text/plain

```
On Tue, 24 Sep 1996, Ronald Kramer reports that his U2K connected to APRS
serial port gives the following WX data:

......_059/000/T068/R000p000b0193h65g000U2K   (which is OK)

but if he feeds it to a standalone Paccomm tiny-2, APRS shows:

......_059/000/068c652p024b0193h27U2KR

Which shows different values:
   1) It dropped the T in temperature (this must be a bug.  I'll fix)
   2) The c652 is the raw rain counter, since now there is no way to
      report the *change* in rain counter
   3) The p024 is probably the second raw rain counter, but it should
      not be there, or at least the label should not be "p"
   4) The h27 is showing humidity, but it is certainly lower than
      the previous value of h65.  DId he have the humidity sensor
      in different places?

THe OFF-AIR raw WX data was: !!0000002AB001827D102FF028C----010A056C

I will check on the T in temperature and the p value, but is anyone else
seeing a humidity reading that is not correct in the stand-alone reports?
Since there are both inside and outside humidity sensors, could I be
reading the wrong one in one of these modes?

I think what we decided was that 10 people would check their stuffed chairs
for loose change in the cushions and buy a second TNC.  Then we can keep the
green star and at the same time, xmit Wx info.  The tempation was to just
leave the aliases intact (WIDE/RELAY) but just not have the green star.  But
that would go against the spirit of the Wide concept.

Thanks to BobAPR and all else who responded.

APRSdos REPLY/COMMENT: YOu can combine 100 devices to your single COM port in any way you want using X, Y or Z cables, but since the GPS is constantly outputting data every second, all you will get is garbled data unless you have a switch. Either Manual or HSP. Period.

APR REPLY: OOps, but if they have the same posit, then they will be on top of each other and only the last one will show on everyone's map... Why not put the repeater TNC up high on a hill where it will do the most good. For that matter, put the WX station up there too... OOps, but then you have the same problem, hi hi...

I earlier wrote, but have since checked the code on these reports:

```
> Ron's U2000 report:    ...059/000/T068/R000p000b0193h65g000U2K   (OK)
> His Standalone report: ...059/000/068c652p024b0193h27U2KR
>    1) It dropped the T in temperature (I'll fix this)
```

*** The T is in the code... Maybe he had a typo when he typed it in

```
>    2) The c652 is the raw rain counter, since now there is no way to
>       report the *change* in rain counter
>    3) The p024 is probably the second raw rain counter, but it should
>       not be there, or at least the label should not be "p"

*** The c652 is the raw rain counter (the second one, not normally used
    by APRS.  THe p024 is the first raw rain counter.  I had assumed that
    everyone was zeroing this every day, so that it could be interpreted
    as rain per day.  I dont think that is a good idea.  We cant guarantee
    that everyone will do this, especially if it is remotely mounted on
    a hilltop...  So I just changed  my code so that this second raw rain
    counter is reported as x024.  I can use any character instead of
    the "x" but I will wait until I hear from Sproul's before I make it
    official.

Yes, BUT.....If you program 10 messages for out-going texts don't you fill
up the incoming message buffer????  We suggested this same idea a year and a
half ago.
I'd still like to see the function available through a "set up" mode then
the pre-coded texts could be stored in the CFIG file and immediately
available on initialization of the software!

Why do you folks keep refering to the KPC3 in this thread?

Have I missed a command in the manual? Is there a way to tell the KPC3 to change from 1200 baud to 300 baud, for the net speed?

Shouldn't you be talking in reference to the MFJ 1270? At least it operates at the right speed for HF nets, and the price is about the same.

regards,
Joe

787. HF/XCVR, UNPROTO,WIDE,W,W

From: bbliss@juno.com (William B. Bliss)
Date: Tue, 24 Sep 1996 14:54:04 EDT
To: aprssig@tapr.org
Message-ID: <19960924.115330.9207.0.bbliss@juno.com>
Rendered body type: text/plain

APRS'ers, One and You all..
    Recient sig messages regarding the subject matter. Appears to me a lot
of users are unaware of the DOS README.DIR files, or they have failed to
read same.
     Also appears no such file exists for the WinAPRS, MacAPRS users. May I
suggest to the Sproul Bro's. include a ZIP'ed file of the DOS README.DIR
with their program., and also a ZIP'ed file should be made available on the
TAPR aprssig. program files, for users to download.
    As APR/Bob mentioned read the following files, as minimum reading anyway:
OPS.TXT, DIGIS.TXT, HF,TXT... There is enough documentation info in these
three files alone, that should clear up some misunderstanding.
    Gateway Rules, Digipeater rules, Routing ops, are paragraphs that explain
a lot on UNPROTO PATHS, use of WIDE,WIDE,WIDE
    " Paths of W,W,W   SHOULD BE AVOIDED. "   Do not Gate VHF, TO HF ,
appropriate paths for Mobile and Fixed stations are discussed.
      The README.DIR has been included since day one of the DOS program,
at least the last THREE years since Ver 2.4 when I started.
     I just recently had two incidences of Southern Calif. APRS ops , QSO'ng
on HF and found they were on VHF. This last one, new nothing about any
readme.dir of unproto paths and was using the following:
WIDE,WIDE,GATE,GATE,
WIDE,WIDE,RELAY.. , with WinAPRS,   No idea of not going VHF to HF..
????????

  New Subj: Re VOX-APRS & Mic-Encoder. If we had a common HF 20Meter
Voice APRS QSO frequency for Mobiles crossing country, and us land locked
sailors, would the same concept of GPS position burst at end of Voice on HF
work ??? as explained for VHF..   ???   APR/Bob, your comments. Were looking
for HF packet frequencies in other bands, how bout a common Voice band

using Mic-encoder concept ?.   Something new to kick around ..

    Also, couple recient Ballon tracking events back midwest/east, how bout
couple HF relay stations of tracking info, for us early risers out here in the
west, nothing appeard on HF band for us to copy. Would it hurt the HF

bands
that much for a mid-west (Kansas City Area, - N0AN/KU0G) allowd to
relay
special events like the balloon runs . ?????

      While on HF, does anyone object to my CWID on 10151/lsb every 30M,
for
propogation information. I frequently hear HH2B from Purerto Rico and it
gives
me an idea of 30M conditions. Perhaps mine in the west and another up in
North East and Kansas City area, would be of some benifit to the HF
users. ??

    On the HF/Transciever, single channel ideas. Two advertizers in World
Radio
could possibely be contacted, as suppliers..

     New one 1st add for QRP type kits: NW2080, Monobanders,
80,40,30,20, 5
watts , Superhet with Variable Bandwidth Crystal Ladder Filter, RIT $75
plus
other..   EMTECH , 3641A Preble St. Bremerton, WA 98312
(360-415-0804),
E-mail <roygregson@aol.com>

      Another QRP supplier may be interested: Wilderness Radio, P.O.
Box 734,
Los Altos, CA 94023-0734 (415-494-3806) , 3 band $295, 6 bands #369.
      Althought QRP rigs & kits, possible more power output transistor
capable.

    73's & Enjoy, Bill/WB6LPG <wbliss@coastside.net// bbliss@juno.net>
NNNN

Mike

What comes with the Garmin 45 besides the unit itself?

John

>$199.  Ten tec seemed interested but still say there is no market.
>
If I could find a HF radio for $199 I'd sure consider it for APRS. Maybe
they don't think there's a market for it because no one is asking. Or not
enough people are asking.
   I just bought my first HF radio used. I'd like to consider a HF APRS
system. It was a tough decision just to put the money into a VHF station for
the hobby. But I cant justify tying up a thousand $$ radio for APRS. If
there was a $199 HF radio, I'd definitely look into it.

   May a bunch of us could do a mass email or call-in to ten-tec or a
company doing the kit type radios. Just how many request do they need?

Rendered body type: text/plain

I really meant the out-going buffer. Dyslexic being was I, me excuse Please

I still think that it should be a matter of configuration, though. What about instances of high traffic? The user is probably going to need that out-going message buffer area.

Here's an idea: The F6FBB software reads from a text file that contains the TEN user-programmable messages that are called up by hitting F1 through F10. Obviously some of the F Keys are already in use but isn't there some other keyboard one-stroke thing that we could come up with? I'm speaking from a SKYWARN/NWS viewpoint, as usual because it's my particular area of interest, of course.

Time is critical in emergency situations. Having a little cue card with the F-strings printed would be easy. All of these message could be routed to ALERT or WX or anything similar to the current BLN messages. Only concern I would have is that these messages should ONLY go out once or twice (to allow for collisions) and NOT follow the time-decay methods of normal bulletins/messages/etc...

I'd like to see the system be so user friendly that an untrained operator at NWS could sit down at the APRS terminal and only have to deal with a few keystrokes to rapidly disseminate information to the network (and vice versa!).

One of the biggest complaints that I hear over and over from new users (especially the NON-technical minded/non-computer illiterate/plug-n-play types) is that there is SO much to learn to fully utilize the potential of the APRS software that it's quite overwhelming.

I'm still, slowly but surely, working on a users guide to DOS APRS that combines all of the readme files, eliminates duplication and presents the software in an easy-to-follow manual with the new user in mind. More on this after Marching Band season ends in mid-November, Bob....Was hoping that I could get to PIA and sit down with you on this...We'll talk....

>and traps" that they may not be aware of.
>
>Bill Young

I've been using APRS on and off for two years now, and finally got serious
about it and registered my version, bought a Magellan GPS and mounted it in my
Pathfinder, and have been enjoying the application. And I agree with Bill, let
the new folks come online and learn for themselves.  One look at the Digi
screen and they'll learn how to set UNPROTO.  And they also get a chance to
experiment- when I first set APRS up, I put in an UNPROTO of RELAY,
WIDE,WIDE,WIDE,WIDE just to see what happened.  I pinged and heard this
horrible mess all over 145.790.  I changed my UNPROTO back to WIDE,WIDE
immediately, but the point is I got to experiment and hear it for myself.

If I had left it like that and cobbled up the frequency for very long, I'm sure
a local APRS user would send me a message with a suggestion to change UNPROTO
to something more reasonable.

How about using ALT-F# keystrokes? Anything that makes single stroke
messaging while mobile easier. It doesn't have to be SKYWARN, although
that is what I would use it mostly for, but could also be "nth runner
passing 3rd and Washington now", or even "Navy runner just dropped the
ball!". hihi

Time IS critical when looking at the funnel! (Do I run like hell or stay
my ground, oh, let me hit this key first then run like hell!) I suggest
that the "routed to" be also user programmable. This would add flexibility
to "local special nets" that are still filterable at the staionary
terminal. Just a little flexibility is needed.

> I'd like to see the system be so user friendly that an untrained
operator at NWS

How about the addition RCM (Radar Coded Message) display on the map
screen? The data, ASCII text no more than 4K, is a normal weather product
automatically sent by the WSR-88D NEXRAD systems and is sent out by the
NWS. Again a useful tool while mobile and especially when storm spotting.
Something to go Hmmmm about!

APRSdos REPLY/COMMENT: I agree, it would be nice to have more than 10 lines, but there is no more rooom in APRS. What should I leave out?

You will want separate pre-canned messages for different aplications, it is far easier to load them from various NAMED backup files than constantly quitting and re-starting APRS so you can load a separate CONFIG file, believe me.

Bob and the group,

I also had this problem *UNTIL* I created new config files. I was
using 7.6f, and experienced the "constant redraw syndrome" after I
performed an upgrade (on both my "-9 laptop" and my QTH computer) to
7.7b. I had seen something on the SIG from someone who said that
creating new config files had resolved a similar problem, so I tried
that route. The problem cleared up right away.

This is exactly what i'm talking about. Here a user admits using APRS for two years
without registering, don't try to tell me it took that long for that user to make up
his mind on if he wanted to use APRS or not. Also look at the path he used just to
do some testing (Sure) at other users expense. This would have been prevented if
there was no way for this user to have that type of path.

> John - N5XAK  Don't bother,been there done that, it wasn't worth it. The SMX
connector needs a special crimpng tool, Its not available in solder
mount. The local electronics supply house had the tool and let me use it.
The problem is that it is a fragile connector and I don't believe the
GPS-20 will survive too many insertions. Just get a chassis mount BNC for
the box the GPS-20 is in and mount it that way. Then put a BNC on your
antenna cable. If you get good BNC's the losses will be negligible and
you can try different antenna's.
        BTW I really like the PACCOM/Trimble antenna.

Bill and the group,

You miss the point! It *DID* take him that long to make up his mind about using APRS, and when he (finally...) did decide, he registered just as Bob intended.

Also, take note of the fact that the user tried some "strange stuff", but caught his own error and learned a few things that he can now pass on *from his own experience* to new users he helps.

Because Bob has written us such a powerful piece of software, we have a huge matrix of possible configurations, some of which are "poison". Some of those poison configs are known to us, some are not.   Let's document and share the ones we know about, let's all (registered and un-registered users alike...) find the ones we don't know about, but let's not ask Bob to invest his time in "hamstringing" this valuable tool. We should "self-police" the ranks of APRS just as we do all other aspects of amateur radio, with courtesy and the deft hand of a mentor if at all possible.

Hi,

When I bought my GPS-20 it came with a long line of coax and the correct connector for the GPS-20, then I bought the Trimble antenna from
PacComm,
I then took the Trible antenna apart and removed the coax with the wrong connector, I then replaced it with the coax and connector supplied with
the

```
GPS-20. It works great!

This was my solution, I didn't have to buy or borrow anything extra.
The only draw back was that the coax supplied with the GPS-20 was no
where near as long as the coax supplied with the antenna. Oh well!
can't have everything I guess.

What is wrong with a surplus 2-30 Mhz marine crystal controlled radio??

They cost about $10.00 at the hamfests.
They require a pair of crystals, another approx $15-25 depending on where
you get them.

The cost is now $25-35 for a 100W radio on the frequency that you want it on.

If using HF you are at least a general.  The general theory covers
transceiver theory and operation, therefore repair of a malfunctioning unit
is no problem.

The savings are about $175 over a commercial unit made for the ham bands.
The marine unit will be much more rugged than any commercial ham rig.

Thank God someone came up with an extremely good comment concerning the APRS software package and not making it crippleware! Without experimentation, where would all us be, still using the spark gap?!? Documentation is fine, but what makes sense to one who writes it, doesn't mean that it makes the same sense to one who reads it! Until you've sat at the operators station and listen to the stations he hears (or doesn't hear!), you can't make a valid argument as to why he should not use a wide, wide path. Walk a mile in his shoes before you tell him how to operate his station.

Bob WB4APR

I was asked by another ham in Tallahassee to contact you for information on the APRS shareware registration. He wishes to register his copy of APRS ($24.00) and would like to know what other information/support he would receive by adding the additional $9.00 registration for the weather and $9.00 for the GPS? Any information would be appreciated.   Thanks Phil N4IPH

Another nice feature of the old xtal marine radios that were fazed out with the channel realignment is that they usually come with a neat remote tuner.

Good evening BOb and all....

I also checked into attempting to see APRS LIVE on youpage but .. got all
hanged-up for not having the proper SOFT... JAVA.. SO
THE SIMPLE QUESTION now how where and do I get the proper
soft required... and should make me able to link up and
see your page and I assume many others which require the JAVA
WHICH IS NEW TO ME...(NEWBIE)
any help .. thanks a lot.

Several people in Jacksonville area are considering putting up weather
stations in near future.  An one how accurate the new RS Wx Stns are?  Also
has anyone been able to get the output code so they can be added to both DOS
APRS and WinAPRS.

I'm not too impressed with my Peet Bros U-2000.  It has quite twice before I
can even get around to wiring it up for APRS.

Message-ID: <199609260315.UAA19731@guilder.ucdavis.edu>
Rendered body type: text/plain

```
Hi all,
        Well thanks to some of you I downloaded APRS77b.ZIP onto my
Macintosh and deleted all but the docs and maps. (DOS .exe files are
fatally toxic to Macs) The result, most of the info I need and some nice
maps which Mac APRS can convert to it's own format, cool. I must say, as a
Mac user I would not have been able to guess (as in fact I did not) that
most of the documentation I need is gotten this way!
        Anyway I strongly agree that the Doc files from APRS should
accompany Mac APRS, and Win APRS. Also I think having a file named
APRSDOCS.ZIP (even a legal filename) with just the docs would be very
useful. If I had seen such a file I'd have downloaded it long ago. Now at
least I have the raw information. However, I still think that a distilled
doc intended to help new users of all 3 softwares keep from screwing up
would be in all our interests.
        I agree that education is the key to a good network. Hard limits,
except for perhaps ones on things that are "NEVER" legitimate, (if there
are such things) are the worst solution. So let's hope that we can get an
APRSDOCS.ZIP file posted just everywhere soon and then anyone who asks can
get a simple answer "Download APRSDOCS.ZIP and read the files." Meanwhile
thanks to all who have helped me.

Don't know anything about the accuracy but they are made under
AccuWeather's name. I do not see a weather station on AccuWeathers page but
then again I haven't looked at their entire site. They did not respond to
an inquiry about one.  www.tandy.com says that the new WX-200 (i think that
is what it is called) will not be ready until 1QTR 97.... even tho the book
says 10/96.  If you see/hear different please let me know.

John these are nobel thoughts and would be great if life was this simple, but
in reallity those users that are determined to use path's like i have talked
about are not about to read anything in the doc directory or they would have
done that in the first place. I know many hams say we have to police ourselfs
and that does sound great if it would only works which it doesn't in many
cases. So the next step is to force the newcomer to abide by the simple rules
set forth in the documentation, and i still stick with the idea that the
users that use unregisters versions shouldn't complain about it having a
limitation placed in it. Only those that have no intentions of ever
registering the software are concerned about this in the first place (And i
see many that run it for years without registering), if you have to be that
cheap then put up with the limitation.

Maybe it's time to create a modular APRS system, Bob, in that each user
can load that portion that they are interested in vs. the whole program! I
don't know if that is possible, but if it were, that would lead to more
user specific programs that use less memory while maintaining the
integrety of your basic program. Modular parts could be the GPS, SPACE,
WX, DX ect. I don't have a need for GPS routines at the QTH! Some more to
go Hmmmmm about!

Ideas anyone?

On Wed, 25 Sep 1996, rwf answered someone else's question:

>    Is there an active UHF freq. for APRS in the Southeast?
>
> We here in the GA area are in the process of selecting one and working with
> the packet coordinator.  The one Bob has suggested before is not in the
> bandplan for packet in SERA territory.

APRSdos REPLY/COMMENT:  The suggested 445.925 was suggested exactly be
cause it was *not* in the packet bandplan, or more accurately, because it
was in the FM simplex area.  It was not suggested as a backbone frequency,
it was suggested as an APRS calling frequency.  With the APRS MicEncoder,
this is a valid argument....  A place where all mobiles can "talk" or
"ping" their position while they drive so that others will see them.

I suggest getting STANDARD Packet channels where backbones or trunks are
desired, but for an AREA WIDE MOBILE APRS "calling" channel, I suggest
asking for an FM simplex channel...

I purchased a Peet Bros U-2000 and had the display quit on me for reasons
unknown.  It took one call to Peet (800 number toll free, I LIKE that) and
a new one was on it's way.  It has been working fine for almost a year.
It's a unit, based on my experience that I would recommend to anyone, even
bought one for a friend in the UK (Peet wired it for 220v, no charge).

Yes WinAPRS is supported and disscussed here, many of the topics are
related to dosAPRS, MacAPRS and WinAPRS all at the same time, of course
many of the questions are specific to a version. The  Mac version and
Windows versions are VERY similar and based on the same code.

You can also direct specfic questions directly to myself and Keith
(ksproul@noc.rutgers.edu) if you like as well.

Good idea.  The protocal algorithm is the key and as long as it isn't
modified the modules would satisfy each interest.  Of course, Bob would be
worn out doing "everyones" desires.

Polarization at HF is irrelevant, especially after the first skip.
The reflection off of the atmosphere will change the polarization in
a fashion that you'll never be able to predict.  :-)

Bob and the group,

Regarding Bill Nolle:  Nah, he hasn't made any enemies that I'm aware
of!  I simply disagree with him on this point.  I'm glad that Bill is
out there and obviously read his postings along with the postings of
all my fellow APRSers (sorting the good from the bad :^)...).

Regarding any decision on adding/deleting "features" to DOS-APRS,
that's Bob's to make.  I can choose to "update" to the newer version
or not.  I'm aware of many people that have stayed at an earlier
release just so they don't get "reminded" not to digipeat onto HF!
(Not me!  I'm on the "bleeding" edge running 7.7b!!)

```
ATTN Bob/WB4APR and sig readers;

   Following msg just received from our local NCPA President,
(Northern Calif Packet Assoc.) and forwarding to sig for info,
and consideration at the earliest..... .

Quote: ...                                                   Date:
26-Sep 02:23...

There is a rumor going around, apparently founded on good info.
that AMSAT no longer needs their 144.3-144.5 satellite segment.
```

The NCPA is in the process of verifying this with AMSAT. If true,
the plan is for the NCPA to allocate it for digital use. The information
is coming from the NFCC (National Frequency Coordinator's Council)
via their remailer.

Now, as APRS representatives on the NCPA board, I wanted to give you
the earliest opportunity to discuss (among the APRS folks) the following
comment from one of the NFCC higher-ups....

>From: WhitBrown@aol.com
>Date: Wed, 25 Sep 1996 17:58:04 -0400
>To: coordinators@cs.tamu.edu
>Subject: Re: lower 2 meter Satellite segment

[snip]
>I suggest that this might be an
>excellent opportunity to ask the APRS troops to consider QSY'ing from
>145.79 to somewhere in the vacated 144.3-144.5 segment, perhaps 144.49
> (or even .47 or .48)?.
>
> 73, Whit

In this region, APRS is currently assigned 145.01, while 145.79 is
allocated for BBS LAN use. If 144.3-144.5 is becoming available, I
don't see any problem moving APRS as Whit suggests. This is a chance
for APRS to have at least one nation-wide, two-meter frequency... and
possibly another one (at least in this region).

As more information comes in, I'll post a message to the whole NCPA
board. However I wanted you to have a chance to consult the rest of
your APRS friends as soon as possible... just in case.
    73, Gary WB6YRU@NOARY.#NCS.CA.USA.NOAM

UNQUOTE.....

      For a NATIONAL RECOGNIZED dedicate APRS frequency , we need the
coordination and agreement of all the APRS users in the U.S.
     For many a costly move, with 20-25 digipeaters in our area alone,
quite
a cost to change frequencies, buy new crystals, etc.. Lots of
considerations
everywhere but we should at least ask for a specific frequency right now
and be held for us , and then all agree to move. If want to stay on
145.79
then give up the new requested frequency later.
      Comments and suggestions from all, now is the time to act on a
specific
dedicated frequency. From Here to Eternity... hi...

         Someone close to AMSAT should confirm release of 144.3-5 VHF...

    73's & Enjoy, Bill/WB6LPG Rep for APRS with local Calif NCPA

I suspect it's a matter of station preferences, not to mention budget! I
myself use one of two antennas, a dipole and a R-7. The dipole is much,
much quieter allowing for more signals to clear the Pk232 I use. However,
as the next solar cycle takes off I'm sure the R-7 will see more use. It
has a (unmeasured, and only a theory) better take off angle than the dipole
I use. Like I said, just a matter of personal preferences...

I am following that discussion.  It has been a bit confusing, because of
typos being made.  As a matter of fact, the message that was quoted here has
already been questioned where it was originally posted because the
frequencies it suggests are used for SHUTTLE/MIR UPLINK!

Here is a quote from someone on the Coordinator's Remailer list:

"But, 144.47 and 144.49 are currently used as Space Shuttle uplinks.  144.49
is the standard packet uplink, and 144.47 is an alternate voice uplink when a
combined Shuttle/Mir operation is underway (such as right now)."

end quote

Let's not confuse the issue even more (yet)

Don't the Canadian boys operate APRS somewhere in the 144.3 - 144.5 area? It would seem that this would also be a way to have MORE than just a US frequency, but a CONTINENTAL standard! Wonder if that would be workable down in Central or South America, too? PLANETARY????? (maybe that's too much)

Hello to the SIG,

Well, I think that I have had my fill of the SIG, and got to know quite a few along the way, albeit, no one was willing to answer any of my questions, just alot of T-Shirt promotions, "Poor Bob!" "My location see's more than your location" type of messages, and nothing geared toward the NEWBIE. Although, I did stick around long enough after the fact that I did ask if there was anyone on the SIG that would share what they have learned with APRS to a NEWBIE like myself. I think the APRS SIG is for the most part, a bunch of guys rubbing elbows with each other, "good 'ol boy" back slapping, and if you happen to be a JUNO customer, you were the scum of the earth, and shunned for being one. I know a few bad things about some of the other services that are out there, but you never saw any mention of it from *this* user.

I thought that maybe if I did get some questions answered that perhaps that it would help me in getting some users interested in APRS in my immediate area.

Apparently, my take is this, I would try in my best judgement, add some constructive thought, but for the most part, stayed off on the sidelines, since I know very little of APRS, but no one was willing, even as Bill Nolle calls a "Mentor", to lead/help me to a better understanding of APRS. So, I guess I will go back to working on my JNOS BBS system, building packet networks, or in other words, moving on to something that I take more enjoyment, and pride in doing, and not pulling my hair out to the root because I don't quite grasp APRS, though I was patient to learn, but didn't get any help when I wanted.

So with that, I bid everyone farewell, and thanks for allowing me
to express my feelings about this SIG.

Stacey, aa7ya@juno.com

Now i'm totally confused, the person that posted that message never mentioned
the frequency you are talking about (Right). He was talking about 144.3-5 why
are you confusing the issue by adding 144.47 and 144.49 ?????

>Now i'm totally confused, the person that posted that message never mentioned
>the frequency you are talking about (Right). He was talking about 144.3-5 why
>are you confusing the issue by adding 144.47 and 144.49 ?????

Because I told you that that was a different message in the same list. Look
and you will see that those freqs do fall between 144.3-5.
(at least they do on MY radio).

When Mr Bliss posted his message here, I doubt that he had seen the message
in the other remailer that was posted in response to the one he quoted for
us here.

And because I said in my msg that the issue was already confused. The
thread includes typos of 145.49 vs 144.49 and then someone even added the
other frequencies too. I saw no need to quote all the messages on the other
remailer-= only enough to show that there was already confusion. You just
need to take my word that the other freqs were mentioned.

I'm just letting you guys know what is going on- If you don't want to know,
then tell me and I'll keep you in the dark. You can rest assured that our
discussions are being looked at over there.

Please don't imply that I am making things up.

Bob, SIG or Anybody

Nashville has a little problem that we need some help with.
We now have 2 APRS digi's and are in the process of adding
couple more in the area. The problem is that the digi's
that are running X-1J4 firmware turn to "gray" after few
hours. I use the term "gray" loosely, the star becomes a
green outline with a gray center and the call sign
disappears. The ones that run conventional firmware remain
as green star, as they should. All of the digi's show up
in my heard log 3 to 8 times an hour and all are
WIDE-RELAYS. It is interesting to note that this "fade" is
only apparent on DOS versions, the MAC APRS screen does not
have this same phenomenon. I have seen this with
AEA,Kantronics and TAPR TNC's, Can anybody explain what is
happening ?.

To: aprssig@tapr.org
Message-ID: <324B3AEB.26C6@epix.net>
Rendered body type: text/plain

```
Once again this SIG has yielded quite a thread, of part of a thread, of
a bit of a thread.  If memory suits me (and it usually doesn't) the
original question concerning UNPROTO was some absurd GATE,WIDE,WIDE,WIDE
combination.

Another note concerns the use of similiar "long generic" UNPROTOs on
VHF.  By generic, I mean the regional problems with the use of
WIDE,WIDE,WIDE and so on.  If some users would take the time to learn
the program, and be able to interpolate the information they see on
their screens, they may be able to realize what their own UNPROTO is
doing to other areas around them.

If an APRSer can only "work" one WIDE in their area and their map is
always hoppin'; That is to their advantage.  But what if that WIDE can
"work" another two WIDEs, and one of those two can "work" three WIDEs,
maybe even a previous one.  You see how WIDE,WIDE,WIDE will bounce like
a cracked ping-pong ball?  Moreover, how about the APRSer's in that span
who can only "work" one WIDE?  Their DCD lights will probably burn out.

Once again I bring up one simple fact.  It is up to those involved and
concerned with the well-being, and future of APRS, (let's not throw this
to the authors) to take strides in "Elmering" those thought of as lids.
All things must be considered in your own little corner of the globe: 1.
Frequency, 2. Accepted UNPROTOs, and 3. SKYWARN vs. Keyboarding vs.
staring at the screen, afraid to touch that dial and tick someone off.

Shields are up... Flame away if you must.

What help did you ask for ????????

I keep ALL the APRS sig messages from "day-one" online so that I
can look up information with a Eudora search.

I went back and looked at all your APRSsig postings and I can't
find any questions that you asked on how to use APRS.

Now where's that "Nerd alert" button?

Honestly... I'm prepared for the slings and arrows generated from this post. But please, how many thin skinned "net whiners" can I tolerate? How many of us have been on the outside of a group? I bet all of us. I remember my first PUG (packet users group) meeting where I didn't know anyone, as well as my first ThunderBird ARC meeting. I knew no one. It took talking to individuals and getting involved to learn anything or to get to know people. It took time. I didn't stand in front of the group pitifully begging to be recognized.

Yes, I've been snubbed by other hams and been treated rudely for no reason by good old boy (and girl!) repeater nets. We all have. That's life. You have two choices. Stick around and try to participate, or weenie out.

To Steve and the Group:

I think I asked Bob(APR) this or a similar question about 6 or 8 months ago, don't remember what his reply was.

I had asked if it were possible to have APRS look at the incoming path of a MSG and then use that SAME path in REVERSE as the reply path.

Also, I don't know how everyone else feels but I could loose the USA.map on key 1, so I could have another programmed map key. The reason I suppose that the 2,4,6,8 keys are not used is that most laptops or computers with compact keyboards do not have a separate numeric keypad. So the map keys cannot use all 10 of the numeric keys located just below the Fkeys, cause the ASCII scancodes are different for the numeric keypad and the number keys on the main keyboard section.

A modular approach is something to think about. I'm not sure how to go about the install process using PKUNZIP.exe, seems you would need a script to query the user which modules to install and then pass these params off to PKUNZIP so that it only extracted the required optional components along with the basic required stuff. This will make the overall .zip file larger than can fit onto 1 floppy though I fear, which would hinder distribution somewhat.

The docs could also be zipped up in a separate zip within the overall zip and the one file with the detail text files extracted to the readme DIR, maybe leaving the whatsnew.txt and install.txt in the main zip to be readily available.

877. 1996 ARRL SW Division Convention

From: Mark Fellhauer <sparkfel@primenet.com>

Rendered body type: text/plain

Don't forget the ARRL Southwest Division Convention is October 11-13 in Mesa, Arizona.

To be held at the Mesa Convention Center.

For more info check: www.getnet.com/~davidh/cadxa.html

Unfortunately, I will not be there for eyeball QSO's as I have another commitment. But it should be a blast.

This may be your LAST chance to tour Barry Goldwater's shack (reservations required in advance).

BTW, the Wouff Hong will be Saturday at midnight! I believe Len Winkler of "Ham Radio and More" will be hosting the evening.

I hear about 80 vendors will be there (no swap meet), but again ICOM is snubbing Arizona events.

ThunderBird ARC will have a table as well as the ARA. If you go please remind the ARA that we would be very pleased to get an APRS digi on one of their sites.

I'm sending this to the SIG cause of the number of people affected by it.

The N2IPH-15 WIDE digi in SNJ is temporarly down (for maybe 2 or 3 days). The TNC has given up the ghost. It was an original MFJ-1278 from '88 and has seen much use, lately continous duty as the APRS digi for the past 2+ years. It will be replaces sometime over the weekend maybe by a KPC-3 which will allow us to run WIDE/RELAY at that site. The 1278 will probably go back in service if its repairable.

I know this isn't directly related to APRS, I know this will be of interest to most. And hey, who says APRS can't be of use in cases like this in the future? I think a few APRS'd DF Jr.'s would be good.

Friday August 16, 1996 Mesa, Arizona:

Mesa Police, FCC Agents, and Arizona Repeater Association representatives executed search warrants and arrested three individuals suspected (caught red-handed) of causing interference to ham radio, police, fire, and other radio communications. They were also charged with abusing the 911 system, impersonating police officers, and false reporting.

The interference consisted of transmitting false officer emergency calls (999's), sending "hot tones" over the air, profane and lewd remarks, as well a physical threats and bomb threats. It is believed that these three have been causing interference on many local amateur repeaters as well as public safety frequencies for over a year, but the interference escalated in July 1996. 911 hang-ups on autopatches and general (unusual) QRM raised the ire of ARA interference committee as well as general members, causing them to investigate. Most interference could be heard on the inputs in the Mesa area, and Mesa police had already approached local hams for help in tracking down their QRM problem. Local T-hunters went to the chase, verbal QRM was recorded, and the suspects were pinpointed and surveilled.

Arrested are:

Joshua D. Cavender
3443 East University #133
Mesa, AZ
DOB: 12/21/79

Brad E. Shelley
542 S. 37th St.
Mesa, AZ
DOB: 12/25/79

Christopher R. Johnson
2006 N. Higley
Mesa, AZ
DOB: 05/18/76

I'm told that at least one is a No-code tech. All electronic equipment in each household searched was confiscated (ALL ELECTRONIC EQUIPMENT). FURTHER ARRESTS ARE PENDING. At least one suspect has confessed.
Voice recordings were sent to the FBI labs and they say the case against the three is AIRTIGHT. In fact, no warrants were issued until the FBI was certain that the case would stick.

This is despicable behavior, especially from licensed operators. Too bad 2 of them are juveniles. Perhaps a little time in Sheriff Joe's Tent City wearing pink underwear would set them straight. With only 500 beds available for "yute" offenders in our whole state, they'll probably get sent home to their mommies...

I know Sheriff Joe would love for them to be guests, as it's HIS 911 system they messed with. (G)

BTW, the Ham Radio Posse has expressed an interest in assisting in these investigation in the future. Perhaps some generous vendors here (hint. hint.) might donate equipment and software for this purpose.

Rendered body type: text/plain

On a similar note:

The ARA sent a nasty-gram to a boot-legger using a bogus call sign in August. In light of recent events he seems to have decided to turn his interests elsewhere.

August 30, 1996. Phoenix, AZ.

Timothy Harold Hoffman of Phoenix, AZ was issued a further N.A.L. in the amount of $6000.00 for violations of several FCC regulations. Hoffman is (was) a licensed ham and is (was) a dues paying member of the ARA when his first N.A.L. was issued a year ago. The ARA also voted him OUT of the association. I'm told this is only the second time in twenty years that a membership has been revoked.

It seems the FCC didn't want to prosecute Mr. Hoffman, but a write-in campaign to lawmakers was started by ARA members. Unfortunately only three federal congressman saw this situation serious enough to warrant a response. They are: John Shaddig, Bob Stump, and Sen. John McCain. As a personal aside: I've noted that Republican lawmakers are far more interested in protecting ham radio than Democrats. I only joined the NRA when asked personally by Joe Foss and Sen. McCain. Bob Stump is a local conservative icon who's probably the most frugal Congressional Delegate currently seated.

Enough about the Republicans, I've only heard one Democrat "official" try to intervene in this matter. And this one will blow your socks off: HILLARY RODHAM CLINTON wrote the FCC and asked them respond to the ARA case against Mr. Hoffman!

I hope that in the future we'll be using APRS locally to track these guys down.

I have successfully put GPS receivers in several gliders looking through the fiberglass body. I probably lose a little SNR, but as a practical matter everything works fine.

It should not work, however, if the fiberglass is reinforced with carbon fiber. I haven't actually tried either carbon fiber or kevlar reinforced structures.

As a fiberglass reinforced plastics (FRP) manufacturer I have used various
materials in our products for our customers. Fiberglass and Kevlar have
close to the same dielectric strengths and have posed no problems
concerning RF. Carbon fiber, on the other hand, is very conductive. I have
an RF cure machine and use in with glass and kevlar. However, carbon will
literally cause an explosion resulting in fire. Personally I would not
suggest using carbon based products in any part of the radio hobby.
Especially as an enclosure for a transmitting antenna with high power. I
have never seen any research done on the use of carbon enclosures in the
radio market and would be an interesting one!

Anyway, I drive a K5 Blazer with a fiberglass top with the GPS antenna
mounted inside the vehicle with no noticable problems. The only problem
with a fiberglass top is it doesn't make a ground plane unless I use an
adhesive backed foil stuck to the inside roof. Then I'm not too sure one
wouldn't slowly cook the brain!

>     go Hmmmmm about!

GOOD idea!!  There are several satellite ground control station
programs that
run in this manner and although I use all the modules here, many do
not.  The
system works with noe main controlling program and calls up the
modules it
needs to perforn the needed task.  I would think that APRS would be
a good
candidate for this mode of operation.

```
Thank you for the replies regarding the UHF frequency in the
Southeast. We are currently working on putting up a new WIDE digi in
Central Georgia. The site we will be using is already in use as a packet
BBS and has a tremendous area of coverage; from Clarkesville Ga, to Vienna, Ga. That is approximately a
90 mile radius. We are planning both VHF (145.790) and UHF frequencies on this digi.
        Since there is no established UHF frequency for APRS in this
area, we are going to proceed with the frequency that is recommended by
Bob. When the SERA allocates a frequency for use, we will move to it. I
currently have no concrete timetable for the implementation of this new
WIDE digi, but it is comming! I'm sure you will know when it happens.
        There is terrific interest in APRS in Central Georgia. The local
ARES organization intends to include APRS in its SKYWARN activities.

                                Thanks again for your help,
                                                       de Tom, KR4OL

>
>Thanks,

The REQUIRES SERIALL DLLS message is just to indicate that the DLLs are
needed for that version, not that they are missing.

Open the INTERNAL STATE window, that will tell you if they are loaded
properly or not.

Does TNC input work?

Mark

890. APRS CROSSLINK

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 27 Sep 1996 10:53:45 -0400 (EDT)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.960927091754.16266A-100000@arctic>
Rendered body type: text/plain

A month ago, there was discussion of how to network APRS packets using cross band links. The problem was that curently, there was no way to do it without using up a digi hop at each gateway and node. There is a simple way, however, to do this with an APRS CROSSLINK regenerator. This Chip, simply repeats a packet exactly as it was received. (it has the option of selectively only linking certain TO subnets). Of course it will only work in a crosslink environment, because if any packet EVER was heard again after being crosslinked, it would go on forever!

APPLICATIONS:

1. You live in a hole. Even if you put up a WIDE digipeater, it will only digipeat packets that still have a WIDE to go in their digi path.... It will not digipeat all of those packets that have already hit their last wide and it could disrupt existing network by adding a WIDE to other hops. The CROSSLINK chip, would allow you to listen on a UHF frequency to EVERY packet heard by your DIGI on the mountain and there would be no impact to the existing net.

2) You have some old 6m radios laying around. You put one at your current 2m WIDE site and crosslink EVERY packet heard onto a 6m backbone. The purpose of this backbone is SKYWARN. So you tell the crosslink chip to only crosslink packets adderssed to APRSKY. Only these packets will travel on the backbone. But the entry point into the net will still be on 145.79 so the users dont have to change... You could set up a statewide SKYWARN net...

AVAILABILITY. Will Clement has the MIM chip both transmitting and receiving packets. It would be "trivial" to make it do this.. Right Will?

>
>Thanks!

My question here is "WHY?"  All you need is a TNC and a radio for a
digipeater.  No need to run the computer and software if all the site is
used for is digipeating.

COMMENT: Well, I sure hate to see AMSAT give that up.  I thought that was
used for MIR and SHUTTLE uplinks and scheduled QSO's!  Especially in light
of the impossibility of finding other worldwide SATELLITE channels.  I
personally think that we are only beginning to see the vast potential for
mobile vehicle, boats RV's use of GPS and APRS for remote vehicle
tracking and communications.  Since 30 watts into an FM rig with only a
lightly modiifed TNC will give you a very good uplink to an amateur
PACSAT.  I would hope that one channel in that band would be dedicated
to APRS/GPS position/status report uplinks from mobiles worldwide!

> hearing the direct or not.

APRSdos REPLY/COMMENT: APRS will flag if it EVER hears a packet direct.
Or in the case above, if it EVER heard you via 1 wide.  I would NOT want
packet routing to be based on such chance occurrances.   What you are
asking would be to keep statistics on every packet heard and determine the
"best path" for replies.  I dont have room for all that.

The Baycom should work fine as a normal digipeater. Its your choice - a
computer and a baycom or a stand-alone TNC. Guess it depends on what you
have excess of.

APRSdos REPLY/COMMENT: That is the #1 best improvement that can be made in APRS, but here is the probelm. Using UI frames, you have to go to command moe\de, change the unproto path, then go back to converse mode, then send the packet, then wait up to 10 or 15 seconds for the channel to clear or whatever, to be sure that that UNPROTO path gets used for THAT packet. Once you change the UNPROTO path, you have NO GUARANTEE that it will be used by any given packet in the queue. The UNPROTO is assigned at the instant of transmitting, NOT when you firsst send it to the TNC. SO I have found that you have to NOT send anything to the TNC for up to 10 wseconds or more to guarantee that the packet gets teh UNPROTO you intended before you can change the UNPROTO to smoething eles. This is just too much trouble on ARPS until we go to KISS mode...

Hello Bill, Dave here on Oahu. I guess we APRS users here in Hawaii really don't NEED to see what's going on on the mainland. It isn't like any mainland mobiles are going to be driving out our way.
We run into the same problems during field day and other contests, it's hard to communicate when talking to the back of all the beams in '6'land.
As a San Franciscan born and raised, I used to think that we had a more worldly view than this.
In 1993 while visiting my sister in Woodland, I had my 2 meter HT with me.
Many times on the Sacramento Valley repeater system I was asked what kind of strange call I had. I was even accused of being a bootlegger! <SIGH>
It's tough being an Old Fart Ham.

Hi all,

While I agree that putting some restrictions in the unregistered version of APRS would probably be a good idea, there are a few things to consider. Not the least is that many versions are already released which have no restrictions. Second, while it might prompt some to register it won't necessarily "make them learn" or force them to care.

At the least, making APRS documentation as easily available as possible, and as clear and easy to understand as possible would allow those who do care to "get with it" as quickly and completely as they can. I find "learning" about systems like APRS is one of the things I enjoy about amateur radio. It is satisfying to me to be able to visualize what is going on in the net. APRS is particularly nice from this standpoint.

MAJOR POINT: more and more Mac APRS and Win APRS users are coming on the system. Few to none of these are going to figure out right off the bat that they need to download APRS77 and keep the docs and throw away the rest. Without this material one is really crippled no matter what one's desire to "do things right". So I really hope Keith Sproul will include the DOS docs (the ones that are general) with both his programs. Also, a "docs only" file would make it a lot easier for those already on the system to get the information they need to become competent.

Don't get me wrong, I've been in technical enterprises all my life and I know that there will always be poeple who don't really care and screw things up. What can be done about that I haven't yet figured out (probably nothing). My point is that lets not make it hard for those who do care to do right. It's very easy to forget what it was like to have no idea what a UI frame is or what UNPROTO means etc. Most newbies have no such knowledge.

Well, I've got the docs I need now, and I've already emailed them to another Mac user who asked if I could save him the trouble of downloading a meg of DOS .exe files to get them. I'm just a user though and don't have the time or resources to distribute this stuff. Hope you guys do.

Talk about a need for the APRS SKYWARN. Yesterday we had the kind of storms that you don't want! Tornado and Flash Floods!

Just before 7 am our voice repeater blew it top and there was a need for the SKYWARN net in less than an hour! Fortunately, we had another repeater available to us locally, but it was not connected to the state skywarn net (which has failed anyway). Our local SKYWARN net went into effect at 7:14 am and ran until 4 pm. At 7:43 a tornado was sighted. It took over 30 minutes to get the information through the NWS in LR and back out over "regular" channels. By that time the storm had passed our area and was touched down close to a heavily populated area. Then came the rains. Flooding insued and at least one vehicle was caught and washed down a town branch!

During all this the APRS net was quitely and efficiently being used in the local area. The information as it was happening was being entered by another station and bulletins were being issued as well. What was the NWS doing at that time? They were tied up with un-ending squelch tails from the multiple linked repeaters that totally disrupted the SkyWarn voice net and was of no use! Had we had an APRS SKYWARN Net available and in place, the information would have been distributed and equally importantly reported on time and in a timely manner.

It is ever more clear that there is a need, at least here, for a packet based SKYWARN Net. I hope that this issue will be followed through in the future as "improvements" to APRS and its many uses.

Is there a future for the APRSKY? You bet! During my trip to NY I met with several hams that expressed an interest in the idea. Unfortunately, most were not users of the internet or this group. That will only take time. One thing that kept coming up was the need for a national conference on APRS and it's many uses. Dayton was mentioned on several occations but with reservation as there didn't seem to be enough focus on the issues. Or enough time for that matter. "Everyone goes to Dayton to visit and look at the new stuff" was repeated over and over. Maybe there should be a more detailed agenda planned or planning for longer meetings.

Anyhoo, this is yet another atempt to bring SKYWARN to the forefront and see what happens. I want to thank all those who participated in the previous discussions and for the direct e-mail. I also want to appologize for the bandwidth to those who don't care about this issue. And to those I missed on the trip, well..... maybe next time!

Hello Dave NH6BA,

If you want to see the tables turned just check into the Hawaii /
Cal net any evening
on 20 mtrs. Your area is often 59 + 10 and with a 3 el mono I can hardly
hear the
zillion others (usually 40 or more hi) stations pointed your way.

Ever feel like you'r trapped on an Ill dave?
well your feelings are not lie-in to you. You R.......

Have fun wit aprs and send some RF to the east sometime.

I don't know for sure 0if it can even digi, but if it could, you would have to tie up a PC. A PC costs about 130.00 per year to run (so I have heard). I own a Baycom, and used it twice. Then I got a real TNC so it could work when the PC was off.

Remember a Baycom is a MODEM only. It has no smarts. IT *must* have a PC
attached, running the proper software!

--------- snip ---------

That was not the idea the forcing users to register. You are missing the point
totally!. When a group of new users get on the area system and use path's that
create a total mess, and then as a long time user like myself ask (In a
friendly way) to read the OPS.TXT in order to use the correct path when
keyboarding with another users that's only 10 miles away (With a digi between
them yet) and those people get hostile and send me messages to stick it!, then
no documentation or being a Mentor would ever help those people. Fellows i
live in the real world not one of where everything is perfect like some of you
seem to be living in.

Don't forget Digicom, the original software TNC. It can operate as both a digipeater and a KA type node. It also has the ability to operate from an external ROM which eliminates the need for a disk drive and also can be remote controlled. C64 and C128 computers are almost free for the taking. I use a C128 as a spare packet station here.

Nice try Dave!

Subject was/is "HF STATIONS HEARD IN NE OHIO" The only comments that I
can make to your "un-solicited" input is, You said in your first sentence
" We APRS users here in Hawaii".

You mean to say that there are two of you now??

Dave, if you are up to addressing the issues regarding the lack of
interest in APRS in KH6, or the absence of HF gateways to KH6 and the
rest of the world, I would love to see some "constructive" ideas or
proposals. This SIG (in my humble opinion) needs to address these issues.
after all, if we don't who will? When KH6 needs a HF GATEWAY STATION here
on the West Coast... I volunteer.!

Rendered body type: text/plain

The Satellite Sub band will still be used by satellites.
Including Mir and the ISS.
There will be multiple channels set aside for Mir and ISS Satellite uplinks
between 144.300 and 144.500
channel 1 144.350 World wide uplink
 2 144.400 worldwide uplink
 3 144.450 worldwide uplink
 4 144.490 Uplink for Europe

down link channels for FM Ax.25 1200 baud packet
will be between 145.800-840 and 145.550

FM Sattelite operations requires a minimum of a 30k channel.
The move to 145.800 or 145.810 cannot take place until
APRS and all digi repeaters on 145.790 move south.

All freqs, below 144.500 should be considered "Weak Signal"
and no terrestrial repeater operations of any type should be allowed.

COMMENT: Well, I sure hate to see AMSAT give that up. I thought that was
used for MIR and SHUTTLE uplinks and scheduled QSO's! Especially in light
of the impossibility of finding other worldwide SATELLITE channels. I
personally think that we are only beginning to see the vast potential for
mobile vehicle, boats RV's use of GPS and APRS for remote vehicle
tracking and communications. Since 30 watts into an FM rig with only a
lightly modiifed TNC will give you a very good uplink to an amateur
PACSAT. I would hope that one channel in that band would be dedicated
to APRS/GPS position/status report uplinks from mobiles worldwide!

I posted to the SIG a bit over a week ago (APRSSIG:4800)regarding issues
with subject Internet providers. Since I had sent the original SIG
message there have been a number of comments received.   Each was
interested in how their provider responds to someone else's problems.

 Here is what has happened.

MindSpring has responded quickly, by two people in their organization,
stating that I will not be given an account automatically (because I

said I didn't want it). Great!

Now the rub is on the other foot. I have to deal with
Billing@pipeline.com to get the charges dropped. That seems doable.
Two messages to them have gone unanswered even though follow-up contacts
at MindSpring (the new owner of Pipeline) say I should expect a response
from Pipeline, BUT, they are not able to (I read that as "will not")
intercede on my behalf.

I am waiting to see who is first to respond now, my credit card company
or Pipeline.

I want to get on with Ham Radio, APRS and nice fall weather, but this
little stuff keeps taking the fun out of it.

>>yielded no results.
>>

First thought, can you change the modem port by hardware, telling it it's on
com3 or 4? Have you contacted Mwave? How "new" is it? Can you get a dealer
to help you?

Is there a reason you need it moved? The cardwiz or cardsoft software that
comes with modem PCMCIA cards will handle ID'ing other ports. Other than "it
came with it", can you remove the modem from the thinkpad? Do you want to do
this?

I have a PCMCIA serial card in my laptop and had to disable the external
mouse port in order to get the right IRQ. I now have the PCMCIA card working.

I ask these questions not in needing an answer, just to give you question
that may lead you in a direction to find your solution.

Most of us that know a bit of something or another here started from
nothing. Personally I remember how frustration it is. Unlike others, my
expirience is less than 8 months with APRS. I learned enough to get my
station up, then proceeded to be a pain in the A.. till I either found
someone who was able to answer my question or figured it out.
We have a number of VERY KNOWLEDGABLE people monitoring the SIG. Since
most of us here lead real lives in our spare time, we don't always have the
time to answer some questions that are within our abilities to answer. We
leave it up to someone else sometimes(guilty here). Bob Bruninga, the
Sprouls, and some others do an OUTSTANDING job answering questions, but they
don't have the time to answer them all. So we are trying to do what we can.
I praise those people who take the time to answer for the 43,000th time
what a path or unproto is. But sometimes the "Newbies" have to take a bull
by the horns and read the documentation, or find the SIG in digest mode and
read it first.
I can't beleive the people here would purposely shun someone, but we're
only human and only have so much time. I've watched the sig grow in daily
message volume over the last several months to well in excess of 30-40
messages a day. That's a to keep up with. There are some threads I have to
delete because I am not interested at this time in a particular aspect of
APRS or just dont have the time to read. I assume there are others that do
this as well. It's just the only way I can keep my e-mail time to a minimum

and get back to other stuff.

So to those "newbies" who's questions go unanswered or just slip through the cracks, I can only say don't get too upset. There are LOTS of people monitoring this SIG and I can only assume it will get larger. We try to keep the wasted bandwidth down, but...   very few of us also have the time to take you by the hand so to speak via long distance. Once you get your APRS station up, see who locally is available and use APRS' messaging capabilities to find a local mentor as well.

In my county, we have very few people running APRS, this makes it tough for me as well. Even though NIAN is in my neighborhood, so to speak, I really can't and don't expect any NIAN member to drive 40-60 miles to my house to give me first hand tutoring. This has it's drawbacks as well, for my supporting NIAn from where I live. Sometimes they don't deal with that well. But the fact of the matter is, we're all learning and are doing what we can to help others here and locally.

Have patience and don't assume your being ignored just because you dont get an answer the first time you ask for help.

As I climb off the soapbox, send all flames to me at stupid@email.com

>the time or resources to distribute this stuff. Hope you guys do.
>

This has been a sore spot with me on the WinAPRS program as well. The Sprouls are doing pretty good in the progression of adding and making features work with WinAPRS. Unfortunately they have been lax in the documentaion dept. They say they just don't have the time and all the features arent there so they would end up rewritting the docs. But, with the interst in the WinAPRS version since Dayton and all the new members I see here, there are just too many WinAPRS users asking questions that could and should be including in documetation.

I don't say this as taking a poke at the Sproul's, its just getting to be a fact. They are at a point with the program, and some many new users are coming online, that you just cant assume the user knows how to set it up and get it running right. There needs to be some better documetation for the WinAPRS version. It's rediculous to the a WinAPRS user to download DOSAPRS version just to get the documentation to figure out how to use the Windows version. Their primary concern is in getting the program going and doing the small stuff later. Well, maybe its time to deal with the small stuff because its starting to create big noises.

I have expressed this to Keith in the past, it's up to others to do so if they feel real strongly about it. But in the mean time... do what you can with what you've been give (I better duck after having said that one).

I'd have sent this directly to you and not used bandwidth except you dont have a return email address in your signature and I dont see your real address via my mailer. Sorry all.....

I can sympathise for your situation. Try dealing with a SKYWARN that seems to run things bassackwards and doesnt want to use "real trained and expirienced" spotters and wont even concider interjecting technology during a call out. It took them 2 years to think of turning on a TV in the office that was already wired to cable, and turn it on to the weather channel to see whats on radar.

They've told expirience spotters to leave and are not doing proper training for the current spotters. The "special" training they got at this month's meeting was on hazardous materials handling.. DUH.... The NWS all but entirely disreguards their reports. Now mind you, since my town is west of Chicago in tornado alley, you can see how usefull this group of guys are. Listening to the SKYWARN NET is a hoot. Once a guy was told to "KEY the mic a couple times" if the could hear net control because they couldnt hear his voice. He was less than 5 miles from the repeater. Lookout Chicago..... we're here to help you!

922. Two Chip GPS Reciever

From: Todd Erickson <z008876b@bcfreenet.seflin.lib.fl.us>
Date: Sat, 28 Sep 1996 00:02:07 -0400 (EDT)
To: aprssig@tapr.org

Rendered body type: text/plain

I was reading in EE Times that SiRF Technology Inc has come out with a two chip GPS reciever system that receives the data from the satellites and outputs the data in a microcontroller ready format. This chip set apparently has a whole 1.5 GHz spread spectrum reciever that has a high gain front end and can lock on the birds in 100 milliseconds and outputs the data in a microcontroller ready format. It can also decode 12 satellites at the same time and make certain on-the-fly error corrections.

Just wait until some OEM starts using this chip set. Imagine the cost advantages and other possibilities it will lend to us!

Hi all,

snip
"and those people get hostile and send me messages to stick it!, then no documentation or being a Mentor would ever help those people."
snip

Actually I didn't miss the point. I wrote....

"Don't get me wrong, I've been in technical enterprises all my life and I know that there will always be poeple who don't really care and screw things up."

I'm making a different point. SOME of us, and notably the ones using Mac APRS and Win APRS are having difficulty getting the information we need so as to not screw things up. I'm suggesting that the DOS docs be distributed with these softwares. I'm also suggesting that the "docs only" be made available in a separate file named something like APRSDOCS.ZIP. The reason is that I in my search for information would have downloaded such a file years ago if I'd ever seen one. It took me all this time to figure out that the docs are only in a file which includes the total DOS software.

While this may seem kind of obvious to some of you, it is not obvious to us newbies. Have any of you DOS guys downloaded Mac APRS to see what kind of doc files might be included that might be useful? If you have you're more dilligent than me. Just trying to be helpful here, hope I'm not offending anyone with my suggestions.

927. PCMCIA Serial I/O - THE ANSWER !!!!

From: "Alan K. Unangst" <alanwc7r@primenet.com>
Date: Sat, 28 Sep 1996 12:01:19 -0700
To: aprssig@tapr.org
Message-ID: <2.2.32.19960928190119.00676264@mailhost.primenet.com>
Rendered body type: text/plain

First, let me thank all of you who answered my call for help. Each of you had a piece of the puzzle, and with IBM's help I was able to put it all together. I am posting the "Answer" in the hopes that it will help others with similar problems.

Problem Recap: To have an IBM Thinkpad 760, running under Windows95, recognize a PCMCIA Serial I/O Adapter as com 1 or 2 (Com 2 has the Mwave modem) so that APRS can be run in the dual port mode with Wx or GPS.

The Answer: Go into the Profiles section in system properties and create an additional profile. First COPY the EXISTING profile naming it whatever you want. Now you will have two (2) profiles, the original and it's copy. Restart the computer, a screen will appear asking which profile that you want to load, load the COPY. When it is loaded, go back to system profiles and disable the Mwave (any) modem. save and restart the computer, the same screen questioning which profile you want will come up, chose the one with the modem disabled, and after booting insert your I/O adapter, it should now be on Com 2.

I hope that I have explained this sufficiently so that the process makes sense. I have tried it and it works beautifully.

There is NO NEED to do this for WinAPRS, as the Sproul's program will allow you to choose whatever com port you want, in my case Com 3 IRQ 09, which is where the I/O adapter is assigned automatically after being inserted and recolonized (in "standard" mode). I understand that this is a windows allowable protocol, where DOS (APRS) only allows IRQs 03 & 04. For a better answer, if you really want one, you'll have to check with Bob, Mark. or Keith, or any other Computer programmer wiz (Which I, obviously, am not).

Again, thanks to all who came to the rescue, I appreciated it. I hope that this explanation is helpful. Hope to see you on the map now that signals are getting better!!!

```
I need some help from anyone using Precission Mapping with their GPS. A
couple of us at work have purchased this at work and we seem to have a
problem that depends on the GPS brand that we use.

I have a GARMIN with $GPRMC data output and it works fine, some quirks with
the comm port and some inaccurate data in the map locally but all in all a
heck of a lot better than Delorem map Expert! I also get no data in the sat.
bar graph window.

My co-workers have Magellan Meridians and they cannot get the program to
work. When they view the strings  under GPS Data Window they see the GGA and
GLL data but it does not plot, they DO not have $GPRMC. Does theis program
need RMC data to work properly ? If it does need RMC and does not work with
GGA or GLL then why does my RMC data not display any signal reports in the
sat. window at the left hand side of the page ? I was under the impression
that the RMC data did not have the information on signal levels that the
program needed to display it.

933. Wx Problems in 7.7b?

From: Connie Hulst <chulst@polar.polarcomm.com>
Date: Sat, 28 Sep 1996 17:44:55 -0500
To: aprssig@tapr.org
Message-ID: <324DAA67.164C@polar.polarcomm.com>
Rendered body type: text/plain

I just joined the list. APRS 7.7b is not decoding U-2000 remote
packets correctly, and I heard that this might be a software
problem. Is this true? Any word on when the next version is coming?

73 de Nick Hulst, AA0VY

Rendered body type: text/plain

Howdy folks,

Some time ago I sent out a message to this SIG looking for the calls of
APRS WIDEs in WNY and ENY. I don't seem to recall getting any replies.
Does anyone know if there are any in or around Hamandsport, Ithaca,
Elmira, Binghamton, Utica, or Albany?

Depending on Sunday's weather, a few of us will be making an afternoon
trip to another mountain range near Scranton, PA to run a few tests. We
will be setting up a temporary APRS WIDE who's call should be either

```
WA3LWR OR KD3GG (SSID unknown).  The system will be running 25 watts
into a 13 element beam, on 145.79 MHz.

The goal of our mission:  Try to make contact with "the other side"
...which refers to the PA - NY state line.  We'll be swinging from 285
degrees over to 30 degrees in hope of being able to work a WIDE
directly.  If we are successful, an appropriate UNPROTO will be set, and
the digi may stay up for as much as a few weeks.

If anyone hears (sees) us, please send a message to our callsign.

73 de AL, N3KAE
```

Good Evening Joe,

My name is reginald and live in Terrebonne Que.
In your message you mention that the APRS operating frequency
in Montreal is 145.790 MHZ.
A DIGI station has been in operation in Montreal for the last
2 years on 145.770MHZ on account of the fact that a BBS had
been on 145.790MHZ prior to the start of operation on APRS.
It is presently planned to go to 144.390MHZ in the near future
and possibly move to a different site with a much improved coverage.
Bob WA4APR is aware of that fact.
73 and hope to see your LAT/LONG position on APRS.

936. Docs -The fix-

From: kc5ejk@onramp.net (Robert Winingham)
Date: Sat, 28 Sep 1996 18:35:07 -0600
To: aprssig@tapr.org
Message-ID: <v02140b00ae736b332b98@[199.1.11.140]>
Rendered body type: text/plain

```
>...SOME of us, and notably the ones
>using Mac APRS and Win APRS are having difficulty getting the information

Before the FTP site was reorganized it was a bit easier to get the docs.
Now each platform has a directory of its own.
We don't always look in the other areas.
I run all three version so I must look in all areas.

 >It took me all this time to figure out
>that the docs are only in a file which includes the total DOS software.

Almost correct: Bob puts three type of files on the Upload site:

1. Total latest APRS package.  (1 meg+ in size)
2. Updates of program and any revised docs or readme information (+400K)
3. Just the program.EXE file (+200k)

I am a MAC user and it is so easy to get the docs that PC only users
```

might think we were platform bragging again.

Just download and "drag and drop" on StuffIt Expander 401 and you
get a APRS folder all neatly laid out. There are only 6 or 7 .exe
to delete. (Use zipit of you don't have the Stuffit + program)

View by date to see if there are any new doc items to read.
I change the color of items in a new update download.

THIS doc problem is so easy to fix.

Bob, Keith and Mark are busy so lets let Bill upload a APRSdocs.zip
to the APRS,WINaprs,MACaprs areas. He can update the file when
Bob uploads a new version.

Bill can appoint a new documentation gofer when he get too busy.

John Gafford can help on this
 -when he learns how to upload to the APRSsig FTP site :-)

>Open the INTERNAL STATE window, that will tell you if they are loaded
>properly or not.

I'm not familiar with this. Can you hum a few bars? :-)

>Does TNC input work?

Thanks for the reply Mark,

Yes, the TNC does work. Now I'm convinced that the serial port is working.

So my problem still remains as to how to connect a GPS NMEA output to
WinAPRS. Is there more to it than simply wiring the output of the GPS (a
Garmin 45) straight into the computer serial port?

Thanks again,

 - Steve, N7HPR

It is important that you use NMEA 183 Version 2.0

You must make sure that your GPS is sending NMEA-183 sentences: GPGGA,
GPGLL, GPRMB, GPRMC, GPGSA, GPGSV, GPVTG, and if you are using a garmin
PGRMA, PGRMZ.

the GPGSV sentence is important if you want satellite information
displayed on your screen, and I think only NMEA-183 v. 2.0 is the only
one that supports satellite information

If this is the case then why does this program not seem to respond to my RMC
(and everything else the Garmin puts out) data so that the sat info window
works ?  I was under the impression that the sats signal levels would be
graphed in the window.

1st I thought it was probably looking for another brand of GPS data that may
have it but if it requires RMC like the Garmin puts out then it must be
another problem.

```
GM All,
Just a helpful suggestion to those wanting to use the new Explorer 3.0
mailer. I have tested the mailer and it appears that I have eliminated the
extra attachment of encoding at the bottom of each message.
Here is how I set my config up:

Click on MAIL
Then click on OPTIONS to configure
Click on the SEND TAB
Click on SETTINGS within the Send Tab
Where it says "MIME" under Message Format make sure the "ENCODE TEXT USING"
window says
"NONE".

That should do it.

Sorry for the bandwidth people but thought since we had some problems in
the past it would help others out wanting to use the mailer.

Have a great day and 73..........to all.

>heck of a lot better than Delorem map Expert! I also get no data in the sat.
>bar graph window.

I don't remember the sentence you need for that, $GPGSV, I think. Same as
whatever Bob needs for his plot display. (the one everyone always forgets is
in APRS). ALT-S G P

>
>My co-workers have Magellan Meridians and they cannot get the program to
>work. When they view the strings  under GPS Data Window they see the GGA and
>GLL data but it does not plot, they DO not have $GPRMC. Does theis program
>need RMC data to work properly ?

I already saw another reply to you that said "yes", but that is news to me.
Don't remember it in PM's docs.

Another note.  I have *never* seen any altitude display on the PM program.
Bob's DOSAprs works fine displaying altitude off the GGA sentence.  Even IN
THE AIRLINER AT 30,000 FT I was getting good alt. data from APRS (Radio was
not powered up), but PM showed a big fat blank there.  Maybe a PM bug.

It would really be great if the APRS programs, WIN or DOS could send posits
to PM!!!!!!!

Hi all,
    Two things. I don't think a Mac can deal with a SELF EXTRACTING zip
file since this is a .EXE file. The Motorola CPU in a Mac cannot execute
Intel CPU instructions. Also, the Mac Win docs can be gotten from Keith
Sproul's home page at Rutgers. I don't have the URL handy, maybe someone
else can supply it. Thanks to all for all the help,
John Lakeland kc6vlr

949. APRS forum at Hudson Division Convention?

From: Arte Booten <N2ZRC@gnn.com>
Date: Sun, 29 Sep 1996 11:18:34
To: aprssig@tapr.org
Message-ID: <199609291519.LAA17500@mail-e2a.gnn.com>
Rendered body type: text/plain

```
Hi All,

     I recently received a mailing about the ARRL Hudson Divi-
sion's Convention in Melville, NY on Sunday October 20th.  In
it there was a line that said there will be a forum on APRS.
Does anybody happen to know who is going to be conducting this?

     Just in case you're interested in going, the directions
are (according to the mailing:)

          Melville Hilton Hotel
          I-495 (Long Island Expressway) to exit 48

I'll certainly be there anyway (it's the second biggest hamfest
in our local area) and hope to have the chance to put some fa-
ces together with those arcane symbols on the map!  73

               Arte Booten <N2ZRC@gnn.com>
 (Packet Radio: N2ZRC@KB2VLX.#BRONX.NY.USA.NA)
  [Cruise Missile Coordinates: 40 52.69N / 073 54.06W]

... Sensors say there is nothing at those coordinates ...

950. APRS docs via ftp

From: Bob Derderian <n2iph@cyberenet.net>
Date: Sun, 29 Sep 1996 12:21:27 -0400
To: APRS dicussion group <aprssig@tapr.org>
Message-ID: <324EA206.75F4@cyberenet.net>
Rendered body type: text/plain

```
Hello all,

If you need the docs to DosAPRS you can go to my ftp site which can be
reached from my website. You'll find a link marked "Goto my FTP site"
there.

The URL for Netscape 3.0 and compatable browsers is;

www.cyberenet.net/~n2iph/frontpg.html

for Netscape 2.0 and older browsers which do not support frames use;

www.cyberenet.net/~n2iph/bob.htm

To use Winsock FTP or similar ftp clients use;

ftp.cyberenet.net/~n2iph/.ftp

So now there is another site on the 'net where these files can be
viewed, which should eliminate all the whinning and QRM on the SIG.
```

Bob and the Group...

  I still am having my station graying out.  I tried to delete the old
config file and rebuild and I am still having the problem.

  I have seen the comments that indicated it is not happening for every
one.  Perhaps I need to use the C-F-f option and let everything show up
all the time!  Looking for an answer to your post "Anyone figure out the
difference?"

  (I am using the U-II wx sta.)

Rendered body type: text/plain

I've read ops, digi & several other of the doc files. In a way, I'm more
confused than ever :-)

I can hear a wide (shows as a green star), so I've changed my path to
callsign,wide,wide, where the callsign of the wide is placed.   Is this right?

My alias is set as RELAY, as I'm two or three miles off I-95.

And if that is the right path, exactly, in plain English, does it mean?
Does it mean my packets will go to the wide, then go to another wide, which
will send it to a third, and that one will not send it out?

Doug N3VEJ Perry Hall, MD

Hello All,

Just a note to let others on the sig know the problem of encoding as an attachment at the end of a msg using MS mailer is correctable.. I am using the new MS-Explorer 3.0 with the mailer and news reader.

Here is what I did to correct the problem.

Click on "MAIL"
Click on "OPTIONS" to configure
Click on the "SEND" tab
Click on "SETTINGS" within the send tab
Where it says "MIME UNDER MESSAGE FORMAT" make sure the "ENCODE TEXT USING"
window
says "NONE"..

That should do it...73 to all and have fun..Hope this helps...

Thank you very much for the info Reg.  I recognize your callsign from the
aprs map of Quebec that comes with the dos version of aprs.

Okay on the frequency of the aprs network here.  I am very new to this, but
I did meet one other Montreal ham on 145.79 whose call escapes me right now.
(He lives in Eastern Montreal).  I get lots of American stations, especially
one KB2LML who seems to be sitting right on the US/Canadian border.

Can you tell me - is it a bit like the packet system, where information is
passed through various gateways from one frequency to another?  Will I see
all those US stations if I sit on 145.77?  And does everybody digipeat
information for each other?  Thanks for your help Reg - hope to keyboard at
you some time.  Joe

Doug was wondering about what the path DIGI, WIDE, WIDE meant.

Hi Doug

As long as you can *hit* the digi you specified as the first in the list,
you should digi thru it and out thru the WIDES one hop away from it.  Then
you will digi thru the WIDEs one more hop away (including the one you hit
the first time by using its callsign). This is the inherent problem with
Wide, Wide, Wide  (or Callsign, Wide, Wide).  If you can't hit that first
digi you specified, you will go nowhere except local to your house.

One day, when digis can keep from digiing the same packet twice, the world
will be full of sweetness and light   (ugghh yuck).

Your *alias* of RELAY will allow other users using an UNproto of RELAY
(usually beginners and passing mobiles) to use your station as a hop to help
them hit the digi.  I use RELAY as the first entry in my mobile tracker's
path a lot.  I never know where I will be, and the RELAY helps me hit
whatever is possible.  All our local digis respond to RELAY as well as WIDE.
You can't readily keep your alias as anything but RELAY anyway, at least
with DosAPRS (APRS sets it back to RELAY periodically even if you change it,
unless you use a command that manually sets you to WIDE.)

965. 144.3-.5 Mhz Mobile Satellite channels

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 30 Sep 1996 00:30:40 -0400 (EDT)
To: amsat-bb@amsat.org
Cc: aprssig@tapr.org, wd0e@amsat.org
Message-ID: <Pine.GSO.3.95.960929224213.993A-100000@arctic>
Rendered body type: text/plain

```
> Comments recently on the Frequency Coordinator's remailer indicate that
> AMSAT has no future plans for the band 144.3 to 144.5 for satellite use.

WOOOAHA..  Please consider the following VERY IMPORTANT CONSIDERATION
before AMSAT relinquishes these satellite uplink frequencies.  These
2 meter frequencies are unique in three very important ways:

1)  At 2 meters, the doppler is only 3 KHz meaning that 9600 baud uplinks
    without satellite tracking automatic frequency control are possible.
2)  These frequencies are *not* shared with satellite downlinks.
3)  The path loss is 5 dB less than on any other amateur satellite band.

All three of these combine to make these 2 meter satellite uplink channels
IDEAL for any kind of nationwide (or worldwide) MOBILE VEHICLE POSITION/
STATUS reporting AMATEUR SATELLITE network!  Consider the following:

A)  Automatic Position Reporting and PRECISE TIME via GPS is
revolutionizing communication networks worldwide.  GPS IS HERE TO STAY!

B)  Mobile 9600 baud satellite packet uplinks using a 19" mobile whip and
25 watt FM rig on 2 meters are perfectly viable.

C)  At 9600 baud, a GPS position/status report using the new APRS
MicEncoder format takes under 40 ms.  Using GPS precise timing, assigned
slot TDMA can be used to accomodate up to 2400 stations per satellite
footprint if each one transmits once every 2 minutes.  This could
accomodate over 7200 mobiles nationwide per channel.

D)  Each position/status packet per vehicle contains the following info:
* Position to the nearest 60 feet PLUS Course and speed
* 4 optional analog telemetry values (battery voltage, etc...)
* 1 of 7 pre-defined msgs:  Onduty, Enroute, Returning, Emergency, etc
* Or, in place of the above, any other single line TEXT STATUS report or
message line.

E)  Mobiles transmit these UI frames periodically at a once every 2 minute
interval and are relayed by an APRsat whenever one comes into view.  One
APRsatellite would provide probably 4 reports per mobile per day, 2 in the
```

evening and 2 in the morning. Four APRsats could provide position/status
for all mobiles world wide at least every 90 minutes.

F) Because of the density of mobiles on the uplink, these channels cannot
be shared with any satellite downlinks, and require a nationwide (or
worldwide) allocation. Even though 144.3-.5 is NOT available in some
countries for satellite uplink, the other 90% of the earth's surface
(boats at sea and polar expeditions) could benefit from this application.
There are currently over 1000 members of the HAM RADIO RECREATIONAL
VEHICLE club, and unknown thouands of AMATEUR radio boat owners...

If HAM radio is to continue to stay current with modern technology, then
the use of Amateur Satellites to augment mobile vehicle position and
status communications must be considered as a fundamental need over the
next decade. I may have made some mistakes in the above thumbnail sketch
of the possibilities, but I wanted to get this out ASAP, before AMSAT does
something regretable in giving up currently protected 2 meter spectrum.
Currently published allocations:

144.34 National High Altitude Balloon and ATV voice channel
144.39 National Canadian APRS
144.45 SAREX
144.47 SAREX
144.49 SAREX

I REPEAT, please lets not give up these unique satellite frequencies with
low doppler and MINIMAL path loss WHICH ARE THE ONLY VIABLE CHANNELS for
simple mobile vehicle satellite uplinks.

APRSdos REPLY/COMMENT:  Sometimes your transmitted packet may be received
with a slight garble (such has having a "c" or "cmd" infront of it.  APRS
sees this as a NEW station with the call of cmdW3XYZ and then plots this
garble of your station ON TOP of your station.  Since this was a ONE-TIME
garble, it will eventually fade to gray!  COuld this be it?

APRSdos REPLY/COMMENT:  That is the same as W,W,W since APR-11 is a wide.
GO to VIEW screen and watch what happens each time you transmit, you will
probalby see LOTS of copies of your packet.   (thou maybe not this week,
since APR-1 is still down.

YOur best bet (when APR-1 comes back up) is to use WIDE,WIDE,WA2JNF-4
Which will get you to NY city, or W,W,WA4TFZ which will get you to
Charlottsville.  In both cases you will still also get out 2 hops in all
directions.

If your area has chosen to use a frequency different from 145.79 due to
coordination problems, yet you would still like to see an occassional XTAL
controlled mobile who might drive into your area, consider this:

SImply add a 145.79 RECEIVER at your WIDE site.

You will hear his packet and digipeat it over onto your coordinated
frequency... AND  His puney 1 second packet low to the ground will likely
not be a problem to any pre-existing user of 145.79 while he is visiting.

>anyone, and Bob Burininga, I DO hope I have your authorization to
>do this.  73 all, John - N5XAK...

A xxx.EXE file is USELESS to a Mac user. A ZIP file is at least able to be
read on a Mac (can a PC handle a Mac Stuffit file?). Anyone who has access
to the internet and therefore could have received this message can download
all of this from the internet anyway.

We included ALL of the dosAPRS documentation on the CD-ROM we released in
May at Dayton, these documents have been put together in HTML for so they
can be easily read from any WEB brouser, the are still text files so can be
read individually by anyone who does not have a Web brouser.

I am sorry if I sound a bit miffed but for the most part I feel this entire
dicussion is mute. All of the people on this mailing list have access to
the internet and can download this if they want.  We have been discussing
the issues with Bob and will be including more of the general stuff (i.e.
digis and protocals) in the Mac/WinAPRS documentation.  In the mean time we
have alwasy made avaialble the dosAPRS documentation and it has been on
TAPR all of the time.

Mark

>
>John  Gafford can help on this
> -when he learns how to upload to the APRSsig FTP site  :-)
>

Yes Keith and Mark are busy, but I do not want Bill or anyone else
uploading stuff to the WinAPRS directory other than Maps.  We will address
the documentation issues and will upload the necessary documents.  In the
mean time WE will upload the entire dosAPRS documentation packages to the
approriate areas so that the Windows and Mac users can have access to them
without having to search for them.

Most of the TAPR ftp site is password proctected on uploading and almost
all of the Rutgers site is that way.

I am going to try to have the entire dosAPRS docs up on Rutgers in web
browser form today.

Rendered body type: text/plain

```
The ENTIRE documentation for APRS can be found at

http://aprs.rutgers.edu/APRS/

is is the same as before with the addition of

        dosAPRS Documentation.

This link takes you to a list of ALL of the dosAPRS readme files.  They can
all be accessed by clicking from within your web browser.  These are the
latest (7.7) docs for APRS.

You now have ONE location to get ALL of the docs.

I will be making the ENTIRE directory into a ZIP file, including the images
so that you can download it and view them locally.  This makes it MUCH
faster and makes it so that you do not have to dial in to read the docs.
```

All links are realitve with in the documents so that as long as the
directory structure is kept the same, it will all work. File names have
all been kept 8.3 so it will work under Windows 3.1, Win95 and Mac (and
unix too).

Rendered body type: text/plain

On Mon, 30 Sep 1996, James R Miller commented on Bob Bruninga's proposal
for a 2 meter mobile satellite uplink channel:...

Bob said: The path loss is 5 dB less than on any other amateur band.

> Whilst I have sympathy for your thesis, I'd just like to point out that
> for any given TX power, a given distance and a given RX antenna size
> (area), frequency is irrelevant.

WB4APR REPLY: Very true. But for the typical vertical 1/4 wave omni
antenna which a mobile would use for mobile satellite communications,
and which the microsat will use as a receive antenna, the aperture of
the antenna *is* proportional to wavelength squared and therefore the
overall pathloss is less in this application. Considering the larger
aperture on both the vehicle and the satellite for 19" whips, I think the
advantage of 2 meters is actually about 9.5 dB!

As I understand it: Assuming that there are WIDEs that can hear the next
WIDE .... Your packets will be digi'ed by the local WIDE (callsign),
then the second WIDE, then the third WIDE.

NOTE: Since your local WIDE (callsign) digi's with either callsign or WIDE
it TOO will digi your packet on the third hop, since it can hear the
second WIDE.

I have noticed this "garble" on occasion.....always on my own station call.
Whenever I see it I make sure to check the P page so see if it is there....
If so, I DELETE it right away. Never had a problem with grey out on my WX
stn with 7.7b

Yes, there is an unstuffit for IBM compatibles, it is freely available
on the net, I might even be able to mail you a copy for distribution if
you're interested.

I'm using a Garmin 45 and/or Garmin GPS-20 and both give sat sig levels
on Precision Mapping GPS.  The Garmin 45 must be in NEMA 183 2.0 mode
for this to work.  For example, NEMA 1.5 mode did not produce any
sat signal levels for me.  Go to I/O setup on the Garmin 45 to change
NEMA modes.

Another interesting thing... You can run both PMAP.exe and GPS.exe
and they will talk to each other with the GPS updating the map and
putting the "arrow" on the PMAP display!  This mode worked fine
under WIN-OS/2 (Warp 4.0) but attempting this on Windows 95 crashed the OS.
Because of this I think my Windows 95 partition will soon be history.

I have a couple of possible solutions to the "newbie" problem.  They
have worked well in the *nix world.

1.  Put in a check for undesireable paths.  Give a warning, but allow
the path.  (Netscape does something similar with >4 line signatures.)

2.  Have a config file shipped with an incorrect, but still reasonable
name.  This forces users to read the docs to find out how to get the
program to run.

3.  Require a registration key.  Supply an "unregistered" registration
key in the documentation.

These all work well, with a minimal impact on the experienced user.

Bob, since this appears to be a gigantic problem (I get this 3-4 times a
day), how about stripping the lower case code off the front of a
callsign if it is a c/cm/cmd in front of an upper case callsign?  Should
be just a few lines of code, and would take care of a bunch-o-things,
including gray stations, dupes on the p- l- d- lists and bulletins, etc,
etc.

In the morning, as I watch the screen for the latest aprS HIT from the
digipeater, I geusS HOW ERrors might sometimeS HAVE been caused by
collisions.  A little coffee and cereal, then off to work I drive hoping
that my stand-alone tracker doesn't cause a collision. :)  Start your
day with APRS!

An Open Letter to Mark Sproul:

Dear Mark:

My only motive in suggesting the posting of a zipped file of the
APRS TXT files on the TAPR ftp site was to try to help the MAC and
WIN95 users.  I had no intention of trespassing on your domain, and
apologize if it seemed that way.  I am a relatively new user of
APRS and did not know that APRSMAC had its own little acre on the
TAPR ftp.  And since I do not have the technical expertise to
upload to an ftp, you really don't have anything to worry about.
Also, I find MAC users a little strange as the ratio of MACs to IBM
compatibles in the reald world is about 1 to 99.

Have a nice day.  John - N5XAK...

Stand-alone trackers don't cause collisions.  It's when you try to type on a
laptop in the passenger seat at 75 MPH!

A joke, yes, but seriously folks....

If you're running full laptop mobile APRS, PLEASE keep your eyes on the road
FIRST!  Mount your computer on the dashboard, if possible, or place it in the
vehicle so that you DON'T have to take your eyes off the road and risk killing
yourself or other!

My mobile installation ('93 Chevy Beretta) has the laptop on the dashboard
(passenger side) held in place with a rubber bungee.  The GPS has it's own
cradle and the SPM Switch is mounted to the GPS cradle.
```

I don't have to look at the GPS or the computer to update my position and a
quick glance to do an X-P to send the updated position is easily done without
taking my eyes off the road ahead for more than a second or two.

Not everybody has this type of recessed/flattened dashboard but when I bought
the car last spring mounting the computer WAS one of the considerations in
evaluating the interior. A mini-van was my close 2nd choice because of the
console...

On another note....

BOB B...Why doesn't the position timer reset when an updated posit is received
from the GPS? It would seem appropriate and eliminate the need to hit any keys
to send the new position. At 70 MPH given P>9 timer parameter by the time a
mobile sends the posit he may be 10-12 miles away. This is fine if you're in a
passive tracking mode and this type of accuracy is adequate but what about a
real-time tracking event (i.e. Marathon, Bike Rides, etc.)?
How about a choice of posit transmit periods? Normal or user selectable rate
would serve the purpose, I'd think. Same type of parm input as you're using on
REDRAW RATE....

I see this quite frequently, on any incoming packet. It
normally happens whenever I bring the APRS window into
the foreground (multi-tasking in windoze 3.11). I have
watched the output of the local digi and it doesn't
appear corrupted, so I figured it was just in my receive
buffer and blamed it on poor memory protection in
windoze.

If I run APRS from DOS, then it doesn't happen.

regards,
Joe

A self-extracting ZIP file can be unzipped by a regular unZIP program.
It's simply a standard ZIP file with a small header tacked on.

And yes, there are un-Stuffit programs available for the PC.

I agree with the 9.5 dB statement, but be careful with the "considering the
larger aperture  on both" part. The reason is that only exactly the
transmitter power goes into the upper hemisphere from the TX  1/4 whip, no
matter what the wavelength. (OK ignoring cable losses, nearby object
absorption, atmospheric absorption and a few others). Thus only the
increase in the RX end aperture helps the path loss.

About WinAPRS and weather history data

All of this is currently able to be done under MacAPRS, therefore it WILL
be ported to WinAPRS, it is not real high on the list but should be done in
a few more months.

Mark

18. APRS HF Dedicated Xcvr: FCC Part 15 Testing

From: John.Klingelhoeffer@comsat.com
Date: Tue, 1 Oct 1996 16:58:38 -0400
To: aprssig@tapr.org
Message-ID: <25188FA0.1957@comsat.com>
Rendered body type: text/plain

A couple of weeks ago, I posted a note about discussions I'd had with WB4APR about a dedicated HF transceiver for APRS use. I'd mentioned in that that one of the things that had dissuaded me from going much further on it was the need to submit the prototype design to an FCC test lab for Part 15 testing prior to kitting or manufacturing.

Offline in private conversation (if you can call 2 meters private!), Bob asked me if I was sure about that with regard to kits. I have gone back and checked 47CFR Part 15, and yes, indeed, that would be required. Per part 15.23 (referring to a kit type device):

"15.23 Home-built devices.

(a) Equipment authorization is not required for devices that are not marketed, are not constructed from a kit, and are built in quantities of five or less for personal use."

Since these devices would be both marketed, and a kit, testing and submission of data (by a qualified test house) does apply. I also fall back to my time as a design engineer for Heathkit in the late '70's and early '80's to know that at least at that time we had to go through this for each kit model that had a receiver within the Part 15 range.

Again, it does seem very strange to me that one can sell a kilowatt power amplifier kit without having it tested, but cannot sell a receiver where incidental radiation is the "problem". However, that is the case. Selling a "kitted" or complete amateur radio transceiver has the barrier to entry that the receive section must be tested at cost to the producer, but the transmitter does not necessarily have to.

What exactly consititutes a kit may be open to interpretation; if a PWB alone is sold, and it is up to the purchaser to find the other parts, is it a kit? If you sell a grouping of all of the electronic components, but no cabinet, is it a kit? Certainly, if anything, the performance would probably be more repeatable if only one entity were supplying all of the parts.

I'd still like to know how many APRS'ers would want to spend the $199 for a single channel, single band, low power, FSK only, HF data radio.

Happens all the time to me in DOS. The filter is a great Idea, Bob!!
And Bob- if you say the filter for   c is there, then maybe you broke it,

cause I get a lot of them.

I see it on other calls, too. Used to show up a lot on HSP mode (folks would also become lighthouses), but with the PICO, all that problem has disappeared.

using on
>REDRAW RATE....

Jim- Why not try using HSP mode. I use it and love it! The ALT S P screen allows selectable posit rates all the way down to once a second. Same for the update on screen from the GPS. I use a 30 second screen update rate and the default 180 second position rate. If I need a good screen trail, I can toggle HSP once a second, getting a good breadcrumb trail and then slow down the toggle when I have mapped the road I want.

Why are you using SPM anyway, you seem to be a pretty intense user of APRS- I'd expect you to be using it already (but I do know you sell the SPM switch).

And your comment on how easy it is to do an X P and send a posit.... I have been trying to impress that on the Authors of APRS for other platforms too! Many people don't operate mobile much and have a chance to appreciate the single key commands. No functon or alternate key, just plain, simple single keys (like you can do out of the corner of your eye).

I agree with the facts John has uncovered and with his observation about 'strangeness.' I'd call it dumb!
Describe it as you may, it is a real hinderance to the production of amateur radio products.

But, the cost is perhaps $5000 so it is not a show stopper if there really

is a market. But that is $10 over 500 units (unlikely) or $50 over 100
units (too much per unit).   Don't you see why hams tag along on commercial
units.

From: WB4GQK@W4DPH.#TPA.FL.USA.NA
To : KB8AST@KB8AST.#NEOH.OH.USA.NA

Hi, Well you will not see my station, simply because I use a full wave
30 meter end fed sloper. It's slope direction is 170 deg. Unfortunately
NE OHIO is PRECISELY blanked by my 50' tower.
This antenna was purposely set up to track cruising hams in the
Caribbean. I maintain a list of 29 vessels and pass their positions over
a voice Maritime Mobile net. On an average there is about 3 vessels
that will digi their positions each day.
Generally they transmit between 0800-0900 EDT. The posit
beacons are directed to me and as soon as my station ACKs their
beacon they generally shut down (to conserve power). You should
be able to see the vessels in the P.R. and Virgins. There have
been 5 transmitting from Venezula and Trinidad which are fairly
weak. You may not be able to copy them. AD4MR has a good S7
signal and he is cruising in the San Blas islands, just off Panama. My
station runs every day from 0600 to 2200 EDT.
As a side issue most of these cruising Hams have given our tel
number to their family and close friends. My XYL, N4TFP and I
receive at least one phone call a week for information about a
vessel's location and enroute progress. ....APRS is serving another
great service. 73 de Jim WB4GQK@W4DPH.#TPA.FL.USA.NOAM

I purchased the software last Wednesday and have found that is inoperative with a Magellan Meridian. A Garmin seems to work fine. Only the RMC statement is missing from the Magellan. Neither has the satellite information working. I contacted the company Sunday with e-mail and have yet to receive a response. Monday I did call and was informed that a new version of the GPS interface would be released and available through their web page. I wrote a small letter including a few line of sample data from the Magellan and faxed it over to their company. I am patiently awaiting their response. I am not directly on the APRS sig so please E-MAIL me direct.

Mark,
   I am using the Davis Weather Monitor II (COM4) and an MFJ 1270b (COM2)
under WinAPRS 1.1.3

   All weather data gets transmitted correctly, but in the Weather Display
Window, the current wind direction
   shows up on the upper compass rose, while the current wind speed shows
up the the lower box.

   What are the two compass roses and the two wind speed boxes?

    (The upper wind speed box never shows and data)

    (I don't know WHAT the lower compass rose is displaying.)

I don't think so. I zeroed the memory and my station still appeared
gray. Looks like I need to go back to 7.6f.

26. Re: [APRSSIG:5280] Matt (WT3C) & USCG Icebreaker "Polar Star"

From: etjm@ECUA.NET.ec (teodoro jaramillo)
Date: Tue, 01 Oct 1996 20:48:26 -0500
To: aprssig@tapr.org
Message-ID: <9610020340.AA46794@ecua.net.ec>
Rendered body type: text/plain

Hello Bill and HELLO MATT W T 3 C ....

Short msg to reunite efforts and fun and new digital techniques
nowdays....sosrt of lost each other on pactor-short and long
path for a while...great opportunity to "TRACK THE POLAR STAR".
everyone around will be delilghted and a great challenge..so with
the efffective help of Bill and everyone on this net.... i do not think
you have an alternative.... have to set up a 30meter. system
with a vertical,tunned or anything on the   Breaker.... Great to see you ...
My efforts are at this time:
486 dx 4 100 and or course APRS.
ICOM 765 (TCXO) ON 10.151 USUALLY AT PROPAGATION TIMES WHICH ARE
EVENINGS 2300Z TILL 1200Z OR SO MOSST OF THE TIME.

BEACONING WITH A   PACCOMM TINY -2 MK2-GPS AND A   KAM+ GATEING
FROM VHF TO HF AT TIMES WHEN MOBILE.. NOT TOO OFTEN...AND FIXED
AT 0255.15S 0799.56W AND 2860 METERS ABSL.
ANTENA B & W BETWEEN TWO TOWERS ABOUT 75 FEET OR SO....
FUTURE SYSTEMS STUDYING THE POSSIBILITIES AND SERVICES OF EITHER
A ULTIMETER-II AND OR DAVIS SYSTEM (UNDER STUDY AT PRESENT TIME).

So far I am the only (crazy sysop) doing all digital modess inclu
dying some sats, and pactor 1 and 2   Clover and also contesting
RTTY at times. Just need more time.....
Well i have taken note of your address at prodigy and will not
abusse the aprssig net... again.

Much to learn yet at this end but friends very helpful and reading
an average of 50-80 msgs a day keeps you busy with APRS and variations.....

Look forward as well as everyone else to TRACK the POLAR STAR in it's
artic approach... long ways from ECUADOR'S ANDES but will do out best.

Thanks Bill for posting and Bill also got me into the net a few
months ago....sure great.
Let us all know tyour operating routines for the future and I shall be on
the llok out for   gps-aprs and other pactor and g-tor as well...
  73's and   next msg will be thru Prodigy. Please do it
likewisse when you can...

etjm@az.pro.ec.

Well, I tried to build an HSP and failed. I got in a hurrt as I had an event to track (the Olympic Torch Relay) and had to get the GPS interfaced and operational. I'm thinking that it may be best in the long-run with regard to channel-loading to use the SPM and force the xmit at my choice. Obviously if I am following a wall cloud then I'm going to want to uplink my position VERY often whereas when I'm mobile on the way to work I don't transmit my position more than every few minutes.

Maybe one of my local brethren in APRS will send me a better schematic than I have in the APRS docs. I'm a little fuzzy on what connects where in that printout....

those silver colored plastic db-9 connectors conduct electricity and
ground out your circuit unless you insulate it....make sure the
transistor legs cannot touch the body of your shielded 9 pin connector
before you give up on the idea....mine works great and was built right
from the docs.

To the APRS SIG,

WHEREAS, I have successfully constructed (from the schematic in the
APRS docs...) and utilized an HSP switch.

WHEREAS, Jim has "commented" several times on the operation of my HSP
switch, and how much he'd like to get one working.

THEREFORE, Wishing to advance the APRS fraternity, and since I'm a
very kind, generous sort of person (as Jim will attest to...), I will
take pity on Jim (my fellow Kansas City APRS Working Group Board
Member, friend, and APRS mentor...), and help him install an HSP
switch. ;^)

Jim, you get the parts and a "proto" board, and we'll build you an
HSP...

THANK YOU, Bill, for getting the point, and correcting an emotional
respsondent, who didn't.  It DID take two years to make up my mind, because I
didn't see all the features in the software I needed when I first started using
it.  I downloaded a copy now and then to check out it's progress.  I support
shareware staunchly, and register all software I USE.

And experimentation is one of the bases for amateur radio.  I EXPERIMENTED with
the wild digi path, I didn't set it up and walk away from it.  I thought I made
it clear in my message, but you can always count on someone to miss the point.

Thanks again, Bill, for your level-headed view of the world.
Rich

I missed the area where it talks about where (what directory) to put either
of the .DLLs when I am using Windows 95.   I didn't see it in the WinAPRS
documentation file included with WinAPRS. Would someone tell me:

- What is the subdirectory arrangement necessary for WinAPRS?

- Is folder WinAPRS the required name in the root directory?

- Which system directory do the DLL's go into?

- How do you know which DLL to put in?

- What is the minimum RAM memory necessary?

Make it simple, us Mac users are used to plug and play. Thank you in advance.

Larry,

The DLL's are for running WinAPRS on a 16 bit system like Windows 3.1,
if you are
running Win95, then you don't need the DLL's beacuase the program is 32
bit and so
is your operating sydtem.

Hope this helps you. I'm back into the wood work.

Hi Don;

According to the "welcome aboard" message I received, when I subscribed
to a mailing list at tapr.org, tapr uses a listproc, not a listserv. If
you address your commands to the address listproc@tapr.org you might be
able to accomplish something.

regards,
Joe

  There is nothing wrong with the listserver, it is working as designed.
The problem is with the user who did not follow the instructions he was
given when he subscribed.

To: aprssig@tapr.org
Message-ID: <108031@tomcat.gsfc.nasa.gov>
Rendered body type: text/plain

I have received several signal reports that the beacon is being heard for a few miles. Obviously coverage is limited by the lack of a good area digipeater on 145.79!

Bob, N3OZB says that the beacon signals work well at improving the performance he gets with his Motorola TRAXAR+ (providing, of course, that he can hear them!).

Has anyone else besides Bob & me had any luck in using the W3IWI-13 DGPS corrections?

Has anyone got a suggestion on how to improve the coverage, especially into Chesapeake Bay? (Like for WB4APR: if the old APR-1 site on the tall tower isn't available, howz about a VHF port on your stuff in the USNA lab building?)

73, Tom

Yes right in your APRS README subdirectory, that's where all the doc files are located.

Hi All;

I'm beginning to get a little frustrated and I can't believe I am the only one with this problem.

I'm looking for a particular map. I have searched through a bunch of zipped files of map collections, with no luck.

Before I start systematically searching through every map collection on the tapr site, is there a master listing of every map, with a source file identification?

What's really bad, is it is listed in most maplists, including the maplist.usa. The mapfile I am looking for, right now, is Caribean.map.

regards,
Joe

Bill,

Come on Bill! Give the guy a break! He may not even *HAVE* an APRS\README subdirectory, because he may not have the software installed yet! He may be looking for info like the APRS FAQs that many people have on their WWW pages, or he may need info on how to obtain the software in the first place! A little kindness please!

Steve, if you still need information (and we haven't driven you away from the SIG yet...), please feel free to E-Mail me direct. I'll do what I can to help.

49. Maps-Borders & Maps-Hierarchy

From: Arte Booten <N2ZRC@gnn.com>
Date: Wed, 02 Oct 1996 18:36:17
To: aprssig@tapr.org
Message-ID: <199610022237.SAA23638@mail-e2b.gnn.com>
Rendered body type: text/plain

Hi All,

I upgraded to Version 7.7b when it came out and have found it to be a great improvement in many respects, particularly in the new W(eather) D(isplay) features. They ought to come in handy next time we have a skywarn net.

As Bob said, there seems to be no more room left in the APRS code to fit anything else in without giving something up. Well, I've been trying to make some maps from the 100K C-D and found, to my utter amazement, that both the M(aps)-B(orders) AND M(aps)-H(ierarchy) commands are GONE!

I was counting on using M-B to check for overlaps and gaps in my new creations. Is there a way to do this in MAPFIX27 or do I have to go back to an older version of APRS (the zips of which I still have on tape) just to utilize these commands?

```
     I don't know about anybody else, but I've always found the
M-B command useful, especially when I get a new set of maps to
check out (I've got about 2,000 of 'em so far!)  Maybe we can
persuade The Bob'ser to reinstate this in Version 7.8 if you
also miss it.

     Bob, don't get me wrong.  I truly appreciate all the work
you do with this baby.  It's GREAT and I extol its virtues ad
infinitum to all who will listen and have gotten more than a
few stations to try it.   I also realize that this may seem a
bit like going backwards to you, but think M-B was a useful
feature that I used frequently, both as a reference and a tool.

     I've never used the DX-CLUSTER mode except to see what it
looks like and think most people interested in it would be more
likely to utilize more traditional AX.25 systems to access such
a service.  I know you think it's cute and want to keep it in,
but you've gotten to a point where new features can't fit un-
less others are removed.  I don't want to tell you about pri-
orities (we all have them,) nor do I understand about the com-
plexities of programming (my idea of which is File-Run-setup,)
but I think you've removed something which many of us use and
have need of.

     The M-H and M-B commands, although they had differences
were, in my opinion, a duplication of functions in many ways.
Restoring one of them (again my opinion) would be appreciated.
Please consider doing so if at all possible.

     As I said, I've got the utmost admiration for Bob's work
and understand it's a labor-of-love.  I'm not griping.  I'm
just surprised to see this feature which I use so often sudden-
ly gone and was wondering as to the reasoning why he thought it
was no longer needed.  73

Of course your right Bill, but for a person that has access to the net
should be able to go to many of the APRS web pages and grab the
information he wants if he doesn't have APRS installed yet. Like the site
below in my address. Hopefully he did that.

Yes i have noticed that the Maps Borders feayure isn't in the latest
version, i figured that there was something wrong on my end but see i'm
not the only one. I REALY MISS THAT ALSO!!!!!! and sure would like to see
that put back in there also. Take out some of the other useless things
like the NAG screen or DX cluster that i'm sure not even 1/10 of 1
percent of the PARS users use. I could come up with a couple more but i
would get blasted for those Hi.

Another suggestion on this if bob would put out a second version with
several features removed, at least that way there wouldn't have to be all
the programming invloved (I guess). But in any case I would sure like to
see the Map Borders put back in, since I know for sure it's not just my
machine doing it I may even go backwards to an older version to get that
back. I have drawn more then 1400 maps and need that.

Hi Les,

In Netscape Gold go to OPTIONS/NETWORK PREFERENCES/LANGUAGES and Enable
Java.
This might help if it's not checked off. I use to go watch JavAPRS with
Netscape
2.1 without problems, but I was always running Win95 also.

Also, open your "Show Java console" under OPTIONS to see if there is any
Java data
coming in, takes a while be patient.

Hope this helps, back in the wood grain.

Subject: [APRSSIG:5314] More on W3IWI-13 DGPS Beacon
Author: aprssig@tapr.org at INTERNET
Date: 02/10/96 2:28 PM

I have received several signal reports that the beacon is being heard
for a few miles. Obviously coverage is limited by the lack of a good
area digipeater on 145.79!

Bob, N3OZB says that the beacon signals work well at improving the
performance he gets with his Motorola TRAXAR+ (providing, of course, that
he can hear them!).

Has anyone else besides Bob & me had any luck in using the W3IWI-13 DGPS
corrections?

```
Has anyone got a suggestion on how to improve the coverage, especially
into Chesapeake Bay? (Like for WB4APR: if the old APR-1 site on the tall
tower isn't available, howz about a VHF port on your stuff in the USNA
lab building?)

73, Tom

> Has anyone got a suggestion on how to improve the coverage,

APRSdos REPLY/COMMENT:  BINGO!  Yesterday at 1600 the power was finaly
restored to WB4APR-1 at 300 feet AGl/ASL.  We now have our WIDE back!
And I am seeing a full system of 96 stations in just a few hours.

TOM, set your VIA path to DGPS VIA WIDE and from your location, you will
probably hit THREE surrounding WIDES.  That should increase your radius
from about 10 miles to 50 miles for a 25 fold increase in coverage with no
increase in channel loading, since all three WIDES will probably repeat at
the same time...

Bring up APRS now, and your map should fill up! hi hi

BOOK ABOUT APRS - ONE OF MANY

I found "PACKET: Speed, More Speed and Applications" 'a collection of
Advanced Packet Methods and Activities from ARRL Publications and Other
Sources'. Chapter 4 discusses APRS applications and has a good section
on interfacing GPS & Loran devices by Bob Bruninga, MacAPRS overview by
Keith & Mark Sproul. Included in the overview is a section on 'Packet
Tracker' and Meteor Scatter Experiments.

Thanks Bob;

I went through the SEmaps, a couple of weeks ago, when I first started
looking. I suppose I might have been looking at the wrong version.

The problem is solved, as someone sent me the map by e-mail.

Regards,
Joe

70. Maps-Borders RETRACTION!

Hi All,

In my previous posting I was a bit upset about what I
thought was our loss of the M(aps)-(B)orders and (M)aps-(H)ie-
rarchy functions. I suppose this just goes to show that we

should ALL, even the most experienced of us (which I am most
certainly NOT!,) READ THE DOCS every now and then before we
insert our podiatric appendages into our oral orifices. Of
this I must shamefully admit my guilt.

     It seems these features have now been moved to the (M)aps-
(P)lot submenu, there to be found as (B)orders, as before, and
(O)verlap, which seems identical to the former (H)ierarchy. My
sincerest apologies to Bob B. and all those on the SIG. That
popping sound you just heard was the sound of my foot being
extracted from my mouth when I should have known better and
READ THE DOCS!!! 73

Bill,
You were nicer to him than I was... I sent him a nasty email... I am an
Advanced Class who goes out of my way to help new commers (elmered 10 so
far!) and I tend to get a little pissed about stuff like that. Anyway,
basically thinking about getting into APRS but I know little more than what
APRS stands for. Any help you can give will be appreciated.

In a message dated 96-10-02 17:04:08 EDT, you write:

> Yes right in your APRS README subdirectory, that's where all the doc
> files are located.
>

Thanks smartass.. I don't have an APRS README subdirectory... I don't even
have a APRS directory as I don't have any APRS software.

Steve

        [APRSSIG:5319] Help JavaAprs Win3.1

Hi,
    Today I installed Netscape 3 Gold for Windows 3.1 but I
still get the same message.
Is there some other software that I need to install to enable javAPRS to
work or will javAPRS only work Win95 or NT ?
Thanks for any help.
--
Les Owles [G4IRJ]
lesowles@tgis.co.uk

The only Netscape that supports Java and Java Script in a windows enviorment is Netscape 3.0
and up for Windows 95 or Windows NT. Java Script is supported on Windows 3.1 and 3.11 but
not JAVA.

WRONG WRONG WRONG

First, the ENTIRE directory structure IS in the documentation
        http://aprs.rutgers.edu/APRS/WAPRSDOC.HTM
        Look at the installation section

Second, there are 3 DLLs, the docs say you need all 3 of them, this is to
make life easier.  Win95 needs one, Win 3.1 needs the other 2, so what Joe
said is incorrect.

>> - Is folder WinAPRS the required name in the root directory?

        No, you can name it anything you want

>> - Which system directory do the DLL's go into?

        The DLLs (all 3 of them) go in the SAME directory as WinAPRS.exe

>> - How do you know which DLL to put in?

        Put all 3 in there and dont worry about it
```

```
>> - What is the minimum RAM memory necessary?

        From the docs

        WinAPRS has been tested on a 386 running Windows95 and while slow,
        worked just fine. A 486 of at least 33MHz and 8 meg of Ram
        running either Windows95 or WindowsNT is recommended.

        It will work and has been tested on a 4 meg Win 3.1 machine

Mark

Hi Ronald,

Robert Swain's email address is rswain@prodigy.com, but he may be out of
the
country for several months. Is there anything I can help you with;-)

Also, I think he is out of the interface boards with no intent to
replenish
them since the DFjr, but better to ask him to be sure.

Actually, an operating system which can handle long file names
is required which has nothing to do with "32-bit".  Java file names
are all "long" ie: javaprs.class .
Some Java friendly Operating systems are Mac OS, OS/2, Linux,
Windows NT and Windows 95.

```
TAPR Office to reduce to minimum operations                     Oct 3, 1996
-------------------------------------------

The TAPR Office will shutdown to minimum operations starting October 8th and
running at least until October 28th.

This means that Dorothy will not be working the office phones during this
period.  The office will continue to operate, but at a much reduced level.
E-mail, US mail, Voice Mail, etc will still be received and recorded, but
everything will be processed at a very much slower rate during this period.

GPS-20 units have begun to ship.  As of this e-mail, approximately 40 units
have shipped.  We are awaiting additional pins for the connector (suppose to
arrive Oct 11th) in order to complete the remainder of the units.  These
pins replace the ones that were incorrect in the shipment we received.  Once
the pins arrive, we will get the other units out as soon as possible.

The Motorola EVM56002 have been placed on order and are expected to arrive
sometime after Oct 21st.  They will then be shipped out as time permits
under the operational schedule at the office.  There are something like 60 of
the 200 units still available in this purchase at the $85 + $10 s/h price.
Check the TAPR Web page for full details www.tapr.org.  First come basis on
these units.

TAPR is sorry for any delays that the reduced operations schedule at the
office might cause.  If everything turns out positive, the office should be
back operational towards the end of October.

Cheers - Greg Jones, WD5IVD
President, TAPR

Right off hand i can't tell you but i know there's a direction finding
page on the web that covers his DF stuff. I think there's a link to it on
my WA8INZ page just below the Agrelo link. If you still can't find it let
me know and i will track it down!.

85. Magnavox MX4200, anyone want one?

From: bob <w2g3zfj@unix.asb.com>
Date: Thu, 3 Oct 1996 11:57:34 -0400
To: aprssig@tapr.org
Message-ID: <199610031557.LAA14558@unix.asb.com>
Rendered body type: text/plain

Hi Folks

I have an MX4200 for disposal. Includes simple RS422<->RS232 interface, full docs, 4200.exe control program etc. Works fine, ideal for standalone tracker (I use one in the car). Ideally needs an amplified antenna, but lock *usually* obtained on a passive antenna. I typically use the Garmin amplified antenna with my MX4200's but have also used a generic amplified antenna, the Paccom one *should* work as well. Operates upto 80,000 ft and 1000knots, no 99knot limit like the Garmins! Will also supply unlimited EMail help to get it going with APRS!

If interested let me know by DIRECT Email please NOT via the SIG!

73 de bob w2/g3zfj

w2g3zfj@unix.asb.com

PS For those who don't know what an MX4200 is, its a small plastic box (about 6" x 4"x1.5") with three leds on the front for status info. Has two RS422 ports, one for control and one for rtcm104 input (DGPS) also has a NMEA port as well. Outputs GGA, VTG and GLL sentences plus lots of other info on satellite status etc if needed. Fully programmable for output rate, sentences etc. The 4200.exe program enables you to easily change all this. Battery back up. 12-24v input. Type 'F' antenna input, 25pin D type for data. Once you've programmed it you only need to turn it on.

86. Re: [APRSSIG:5328] DGPS and ANNAPOLIS WIDE!

From: clark@tomcat.gsfc.nasa.gov (Tom Clark -- W3IWI)
Date: Thu, 03 Oct 96 16:45:17 UTC
To: aprssig@tapr.org
Message-ID: <113152@tomcat.gsfc.nasa.gov>
Rendered body type: text/plain

Bob -- thanks for telling me that the Balto/Wash area now is again WIDE!
I just stopped by W3IWI-13 and changed the UNPROTO route accordingly.

All -- Now that the W3IWI-13 DGPS beacon has better coverage bouncing thru whatever WIDEs it can hit, I am really anxious to get reports from folks in the MD/DC/VA/DE/PA/SNJ area on your ability to use the DGPS corrections I'm broadcasting. In case you missed the earlier postings, W3IWI-13 is sending DGPS beacons addressed to DGPS via WIDE with a beacon sent every 20 seconds. The data is generated in some professional equipment and the DGPS correction quality should be >>BETTER<< than those sent by the Coast Guard on ~300 kHz or by commercial firms like DCI on FM broadcast subcarriers. With these corrections poked into your GPS receiver, you should obtain 1-10 meter accuracy within about 50 miles of the beacon site (Greenbelt MD) and should see improvements out to the 100-200 mile range. The DGPS beacons should virtually eliminate effects of Selective Availability and GPS broadcast ephemeris errors, and will minimize errors due to signal propagation thru the ionosphere and troposphere.

To use them, you need to make sure there is some data path from your TNC's data output into your GPS rcvr's input. This can be a direct TNC->GPS connection, or Bob has hooks in APRS to handle it for you. You may need to enable DGPS data on your GPS receiver; for example, in the Garmin 38/40/45 you need to go to the INTERFACES menu item, and select either NMEA/RTCM or NONE/RTCM. For most receivers, your TNC needs to be set to 4800 baud async data rate to make things work.

So please, send me (or post here) news on how the DGPS corrections are working for you! So far, apparently only a couple of us are using the correction signals.

73, Tom

Message-ID: <v03007800ae79b3d7b74d@[165.1.27.20]>
Rendered body type: text/plain

The entire APRS/MacAPRS/WinAPRS documentation is now in a ZIP file

        ftp://aprs.rutgers.edu/pub/hamradio/aprs/APRSdocs.zip

This file contains the entire Web browser documents for all of the APRS, MacAPRS and WinAPRS documentation. This file is 634K.

Download this file and unzip with the -D option (very important).

Open "index.htm" with your favorite web browser. You will now have
ALL of the documentation for ALL versions easy to access.

Note, you do NOT have to be connected to the net to use a web browser
to access local files

Mark

Hi Guys,
Thanks for replies to help with Java. Seems like I'll have to upgrade
to Win95 :-(
My PC (486dx33) has only 8mb ram so will probably grind to a halt.
Maybe a Pentium for Christmas :-)

Keep on tracking.

89. Non-standard APRS messages

From: "Chris Moore" <cmoore@cancun.rose.hp.com>
Date: Thu, 3 Oct 1996 16:44:29 -0700
To: aprssig@tapr.org
Message-ID: <9610031644.ZM26711@cancun.rose.hp.com>
Rendered body type: text/plain

Hi all,

I'm new to the group, and also new to APRS. My main interest is in Unix
systems, not PC's or Macs, so I'm looking at doing my own software for
APRS.

In monitoring the local channel I've found some unusual things, and I'm
wondering if I'm misreading the protocol (in PROTOCOL.TXT) or are these
people really sending bad messages?

First example:
/3814.64N/12200.08W# (comment here)
According to the spec, immediately following the leading / there should
be a DDHHMM/ field. The only message that begins with a location and
skips the timestamp is a fixed station message, which should start with !.

Second example:
@031622/3636.10N/12150.17W-PHG343.5 (comment here)
The PHG field is supposed to be exactly 4 digits. What's the decimal point
doing there?

Third example:
!3801.10N/12034.59W#PGH5760/ (comment here)
PGH doesn't mean anything. It should be PHG.

I guess I have a few questions - is anyone else looking at the protocol at
this level, or is everyone just running the shareware apps? If these are
being sent by the shareware apps, why do they have badly formatted data?

Any help would be appreciated.

Thanks,

```

Well Southern Ontario is to Canada what Southern California is to the
United States: Band Crowded.

I think I can safely say that Canada west of Sault St. Marie would
definately be using 145.790 which seems to be what most (I didn't say
all) of the States are using. Unfortunately nothing here yet for APRS
usage however for interest sake in this discussion, the local BBS is on
144.310.

> as a flame but rather a word of caution from a fellow ham.

Hi,

I probably should have mentioned this, but I've already been in contact
with Bob and he's aware of my efforts.  If I can't find the answers I'm
looking for here I'll go back to him, but I hate to bother him.

As far as the 'why', there are two reasons.  First is the fact that I
```

prefer the unix and X11 environment. Although I have a few PCs I don't
use them much - I find they generate RFI, are susceptible to RFI, and they
tend to crash a lot. :-) The second reason is for the joy of experimenting
with HAM radio. I've never been the type that could homebrew a rig, but
software I can do!

So, thanks for the friendly warning. I understand your concerns, but as
I said I've talked with Bob and he knows I'm working on this.

Thanks,

Chris Moore

Some questions regarding weather stations and APRS.

1.  We have access to a Davis Weather Wizard III that we would like to get on
the air.
      a.  Is this APRS capable?
      b.  Do both DOS APRS and WinAPRS support this device currently?
      c.  Can it be operated in a stand-alone mode without computer?
      d.  With an associated computer, can all the data logging functions
still operate along with
           APRS and do you have to buy Davis's very expensive data logging
software?

2.  Reference Peet Bros:

      a.  Which is the better value system (U-2000, U-2, or U-500) for remote
weather sites.

I know this is a multitude of questions, but we are trying to get a number of
weather sites up here in Jacksonville, FL.  Thanks for your help.

Actually Jim this fellow is looking into using the Baycom Packet-Modem
(notice I didn't say TNC) as a digipeater thereby allowing the TNC
currently in use to be used for other purposes. I do agree with your
statement that you do not need a computer and the APRS software to run a
WIDE or WIDE/RELAY. But seeing that _old_ computers are next to free (or
even free sometimes) and the Baycom software can run on just about
anything, I should think that using a Baycom for a WIDE would work just fine.

Hi Ken, I hope the following answers your questions:

Davis Instruments units are quite capable of APRS interface in versions
in APRS versions after 7.0....but, you must have a registered version
with a WX registration number, and you must have the computer interface
cable from Davis Instruments.
```

Both DosAPRS and WinAPRS support Davis, but again, only the registered
versions of same.

The Davis unit cannot currently operate in a stand-alone function with
APRS...but it can be a remote unit connected via telephone modem to your
home station.

The Davis Software can still be used (but not simultaneously) to record
data from the wx station....because,

yes, you MUST by the software from Davis because it comes with the cable
which contains the chip that contains the memory that stores the data...

And on the last question, that of value, it really just depends upon
what you need at your station....The U-II is temp/winddir/windspeed,
the U-500 adds the humidity and dewpoint, and the U-2000 adds the all
important barometer...thus the increased cost of each unit.

```

APRSdos REPLY/COMMENT: Bulletins to BLN# and BLNx are transmitted on the
same normal APRS decaying algorithm, meaning the time to transmit is
doubled after every transmission. The diference is that BLN#'s just keep
decaying, while BLNx decay down to once every 12 minutes and stay at that
rate. If you are doing anything in real time which wont mean much 2 hours
later, then use BLN#. Here is the result for the first half hour for
both (9 packets total):

```
*8* 16 *  32  *  1min  *   2min   *    4min    *    8min    *   16min   *

Hi Linda;

The only difference, is in the transmission periodicity.

When you input anything, the APRS software transmits a
packet, then 7 seconds later another packet, then 14
seconds later another packet, then 28 seconds later
another packet... If you permit it, eventually it will
get to the point where it is transmitting the packet once
every 24 hours. Once it gets to this point, it stops
changing the time between packets (I read this in the
docs, several versions ago, but haven't tested it).

Some types of data packets don't do that. The time will
stop changing when it hits a maximum of 20 minutes
between packets. The storms I post are this way and so
are the station position packets and the permanent
bulletins. Of course, if you (E)rase the bulletin, it
will stop being transmitted.

The choice of what type of bulletin to use, depends on
whether the information will continue to be critical
after the first 40 minutes. If it will, then you should
use a permanent bulletin, so any station coming on the
net will still see the bulletin within twenty minutes of
starting their software up.

For short term information, such as "EPAN NET accepting
APRS checkins", the temporary bulletin would be
preferred, so if you forget to (E)rase it afterward, it
will space itself out and minimize the interference with
normal net operations. On the other hand, If I had a
tropical cyclone, coming our way, about 48 hours out. I
would use a permanent bulletin, to announce it, so people
who didn't normally use a large scale map display, would
still find out about it, soon after they came up on the
net.

Regards,
Joe

Greetings all.
I'm trying to set up my own APRS station but I don't know exactly what files to
download. I'm using a 386DX 40 computer with 6mb RAM. Am using Windows
3.11 for Workgroups.   Can use either windows or DOS. I have a Heathkit HD
4040 TNC
running the KISS mode (I think). I am using ProComm Plus software.
Any help appreciated.
